Collection

Preface

We will not succeed in finding the beginning. We can only define a starting point, which is only subjectively determined, no matter how objectively we may argue.

Of course, at some point there was a need to calculate. It probably comes from the fact that we humans always want to compare. I simply claim - adding was the first step, but this is of course only an assumption.

Adding requires thinking, so 1+1 is already a highly complex process. You could explain it with two notches. Defining a result is a huge leap.

How do you represent the result? From the original numbers or do you invent new ones?

Why do you arrive at representations that are appropriate to the position?

The development of language seems much more complex to me, so I assume that arithmetic was developed much faster. It's all subjective.

One of my favorite subjects at school was mathematics. Because it was so simple(?) and clearly structured. My career choice was also obvious: Programmer. I am a programmer with heart and soul, but over time I have learned that development is only possible by looking to the past. That means for example, I used old program parts and improved them in a new environment

At the end of the 20th century I started collecting. It has become a whole bunch of different subjects.

A CPU collection was the first area of interest. I am a very meticulous collector, so I have always attached great importance to the different materials, the different shapes, the different manufacturers and the different labeling. You can find this form of collecting in all areas.

I could fill many pages of a document just by listing the chips I have collected, but that wasn't enough for me. I wanted to find out where they were used, what their development history was and who the people behind them were. Without realizing it, I suddenly foand myself collecting other objects as well.

The document you have opened is a collection of pictures, information and personal views. If any data is incorrect, please let me know so that I can correct it. The copyrights of third parties remain unaffected.

Reproduction is not permitted.

Have fun.

1. Introduction slide adder

A slide adder is a tool for speeding up arithmetic operations.

The tool has numbered columns printed on the front and partly on the back side. Next to each column there are movable sliders that can be pulled up or down with a stylus. A clearly recognizable line presents the result. The number of columns and the number of movable sliders depends on the height of the numerical values that are presented as the result. There is a carryover at the top or bottom, which is used if the result field is empty, i.e. has an overflow

Example

First an excursus on the number systems:

In the hexadecimal system (16s) we count 0 1 2 3 4 5 6 7 8 9 A B C D E F
10 11 12 13 etc.

We count in the tens system 0 1 2 3 4 5 6 7 8 9
10 11 12 13 etc.

In the octal system we count 0 1 2 3 4 5 6 7
10 11 12 13 etc.

In the system of two (dual system) we count 0 1
10 11 etc.

You can see that F + 1 / 9 + 1 / 7 + 1 / 1+1 always leads to an overflow to a higher digit and to the same result of 10, by converting to the tens system of course to 16 / 10 / 8 / 2. Note that new number signs have been invented in the hexadecimal system. So the higher the numerical value on the digit is to be, the more signs you have to know/invent. This means that in the Dual system you only need to know two digits.

Example with 2 columns each and the same number system.

Hexadec. system Column	Tens system Column	Octal system Column	Dual system Column
2 1	2 1	2 1	2 1
F F	9 9	7 7	1 1
E E	8 8	6 6	0 0
D D	7 7	5 5	
C C	6 6	4 4	
B B	5 5	3 3	
A A	4 4	2 2	
9 9	3 3	1 1	
8 8	2 2	0 0	
7 7	1 1		
6 6	0 0		
5 5			
4 4			
3 3			
2 2			
1 1			
0 0			

The number systems can also be mixed very well within slide adders, due to the always identical overflow 10, as can be seen above with the FRACTOMATOR. This is ideal for currency conversion, time conversion, length conversion, etc.

In keeping with the title, I would like to present a dual slide adder. On the left a vision supplemented with a section of the binary calculator Binary Teacher of ADM (center); on the right a section of R129 Addiator basic model currency conversion shilling to pound.

We calculate $1+1=10$

We have two numbered columns with only 0 and 1 printed on them. The slider next to them have 2 holes.

Home position (Abbreviation CO = carryover)

Result	0		0		0	
	Column 2	CO 2	Slider 2	Column 1	CO 1	Slider 1
1	0	0	0	1	0	0
0			0	0		0

Addition means we move down

1. Step 1(+1): Right-hand slider 1 down

Result	0		1			
	Column 2	CO 2	Slider 2	Column 1	CO 1	Slider 1
1	0	0	0	1	0	v
0			0	0		0

2. Step 2 (+1): Right-hand slider 1 down

Result	0		empty			
	Column 2	CO 2	Slider 2	Column 1	CO 1	Slider 1
1	0	0	0	1	0	v
0			0	0		0

3. Step 3 Pull carryover and pull the right-hand slider all the way up.

Result	1		0			
	Column 2	CO 2	Slider 2	Column 1	CO 1	Slider 1
	1	0	0	1	v	^
	0		0	0		^

The carryover is not available on all slide adders. In this case, the user must carry the result forward to the next higher digit. There is usually a reset device, e.g. a bracket attached to the top, to reset the result to 0.

On most of the slide adder you will find the numbers 0 to 9. If you want, replace the calculation for such a calculator with 1+9, i.e. in the 2nd step you drag 9 downwards. You will get the same result. The different optical division of digits on the casing takes account of number systems, currencies etc. are taken into account.

In chapter 16 you will find overviews with examples and explanations.

I have recorded the slide adder in my collection in a database. To identify a slide adder, I have given it a unique inventory number, which is prefixed to the pictures in this document.

If you would like to hand in a slide adder that is not shown here, please feel free to contact me at zahlenschieber@edgar-elsen.de.

2. ADDIATOR

The ADDIATOR company was founded by Carl Kübler in the year 1920. His correct name was Karl Kübler, the C seemed more advantageous to him. The name Meuter (Otto Meuter) was still used for the first calculators. The company's long presence on the international market began on the basis of Meuter's utility model. By 1991, ADDIATOR had sold 5 to 6 million slide adders.

Again and again, new calculators, new design variants or other materials were invented or simply customer requests were fulfilled.

Thanks to the inventiveness of all those involved and the consistent reduction in costs, it was possible to modernize and reduce the price of calculators for a long time, parallel to the development of IT.

The double-sided style is a trademark of ADDIATOR slide adders, which was protected by patent.

Single-sided exceptions are: Arithma models, SUMAX, TOTO, Maximator storage, Duplex single-sided, UNEX, Addimax models for the USA, all models in the Arithma small size

ADDIMULT also built double-sided models. Hans-Wolfgang Kübler, the son of Carl Kübler, founded this company after Second World War. The two-sided construction was tolerated by the ADDIATOR company.

In the mid-1930s, ADDIATOR entered into a liaison with Faber-Castell. On one side there is a slide rule and on the other an integrated slide adder produced by ADDIATOR. In the meantime, Faber-Castell manufactured the combination of slide rule and slide adder entirely from plastic itself; Willi Bülow had initiated this production. Production was discontinued in the mid-70s.

v. 30.12.1918

erste Ausführung (first version)

=====

von Meuter (from Meuter)

gekauft (bought)

Jan. 1919

Unterschrift (Signature)

The First World War ended on 11 November 1918, shortly before the utility model was registered. Otto Meuter had therefore already developed the idea during the war and Carl Kübler was involved early on.

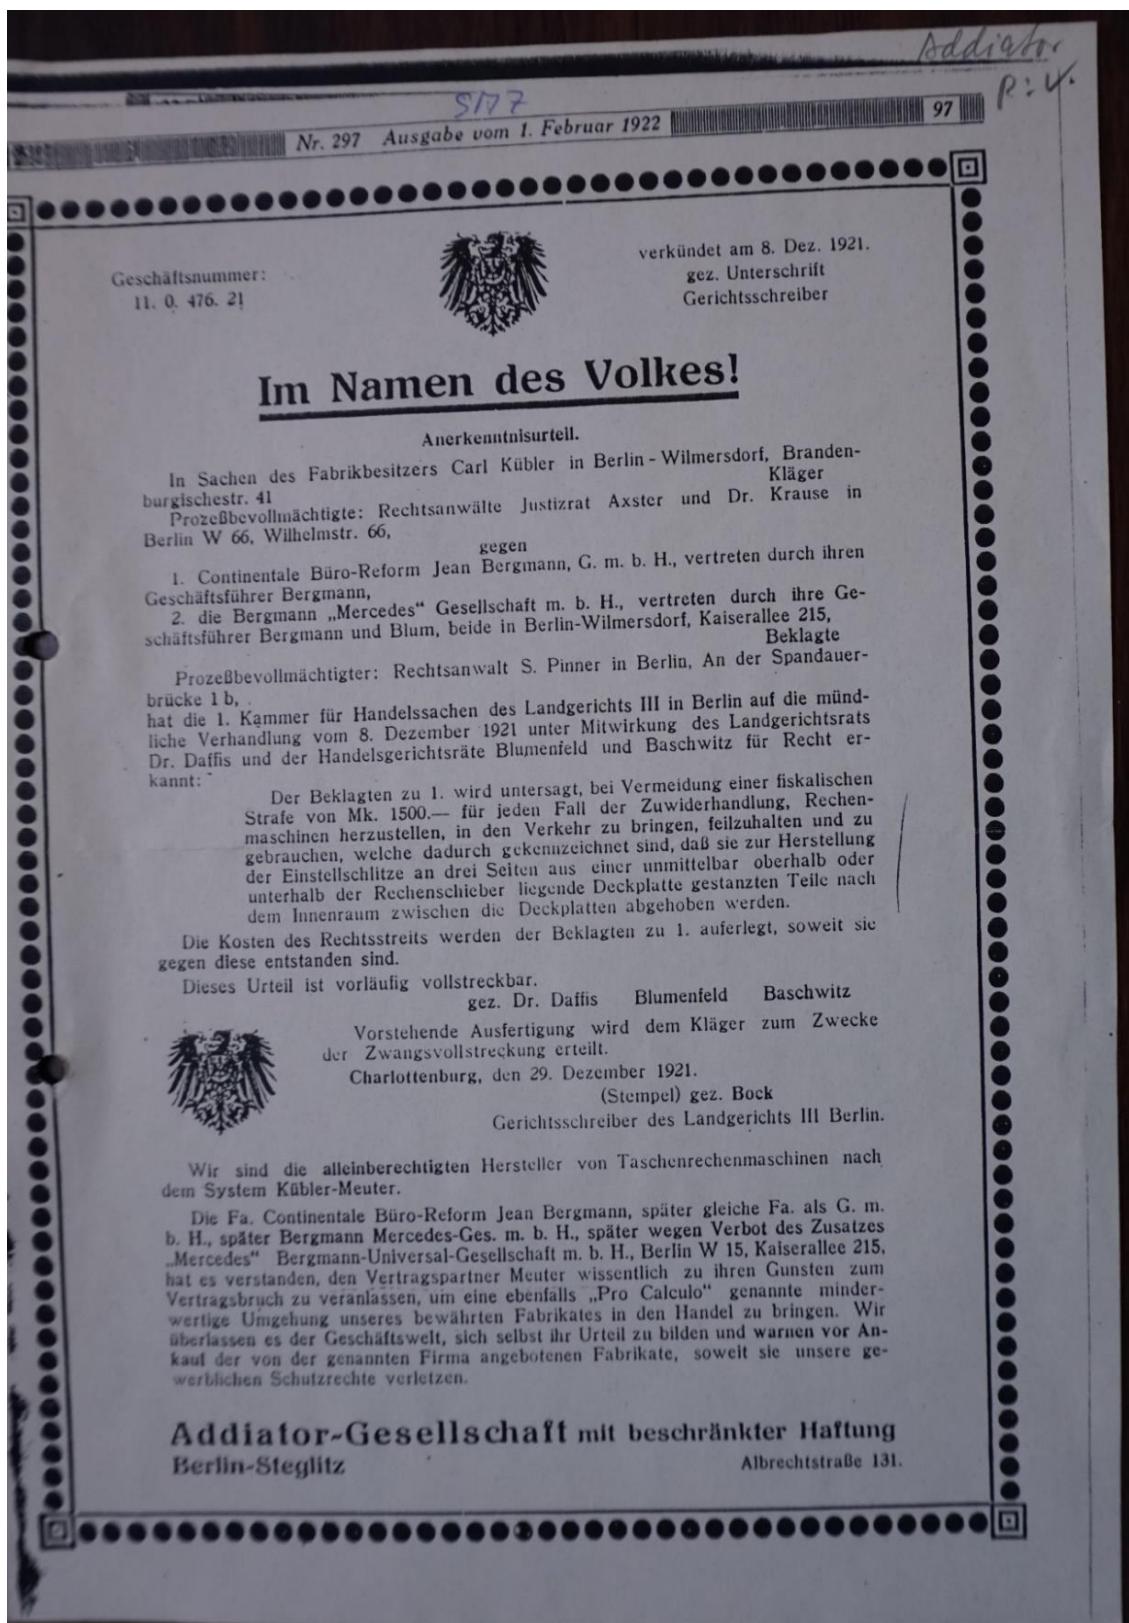

From an essay by Martin Reese for the IFHB HBw 43: The young man first builds a functioning cardboard model and in the Christmas days of winter he writes a suitable description, his claim to protection and makes a technical drawing. "The novelty of the addition and subtraction machine described below consists in the alternating arrangement of the rows of numbers from 0 to 9 on the upper and lower half of the slide adder, so that addition and subtraction can be performed simultaneously by moving them in one and the same direction."

The transfer of tens is also described.

There was a clause in the purchase contract in which Otto Meuter was entitled to a fixed turnover per slide adder. Shortly after the war, however, the value of the currency plummeted. This meant that the shareholding actually became worthless. Despite Meuter's intervention, Kübler did not make any concessions.

As Otto Meuter continued to have access to the ADDIATOR workshops, he began to develop tools in secret with which one-sided number slides could be produced. Through an alliance with a company specialising in sales (Jean Bergmann), it was possible to market new slide adder. As Meuter had taken over a company specialising in the manufacture of metal goods in 1919, it can be assumed that production took place there. Kübler intervened and after a

dispute, an agreement was reached. Bergmann was allowed to continue marketing the slide adder, but production went to ADDIATOR. The Kübler-Meuter system was finished.

We are the sole authorised manufacturers of pocket calculators based on the Kübler-Meuter system.

The company Continentale Büro-Reform Jean Bergmann, later the same company as G. m. b. H., later Bergmann Mercedes-Ges. m. b. H., later Bergmann-Universal-Gesellschaft m. b. H., Berlin W 15, Kaiserallee 215, due to the prohibition of the suffix "Mercedes", has managed to knowingly induce the contractual partner Meuter to breach the contract in its favour in order to market an inferior bypass of our proven product, also called "Pro Calculo". We leave it to the business world to form its own judgement and warn against purchasing the products offered by the aforementioned company insofar as they infringe our industrial property rights.

Addiator limited liability company Berlin-Steglitz

Albrechtstraße 131.

Operating instructions System Kübler Meuter

Die Addiator-Taschenrechenmaschine
(System Kübler-Meuter, D.R.P. u. Ausl. Pat. a.)

Der „Addiator“ ist eine in Taschenformat handlich gebaute Rechenmaschine, bestehend aus zwei getrennten Rechenwerken und zwar einem additiven und einem subtraktiven, welche innerhalb der Maschine zwangsläufig verbunden arbeiten und gleiche Resultate anzeigen. Die charakteristischen Merkmale stehen unter Patentschutz und ergeben praktische Vorteile, die kein bisher bestehendes Rechenmaschinensystem aufzuweisen hat.

Die Bedienung ist ohne weiteres ersichtlich, einfach und unvergleichlich. Die Befolgeung einer kurzen Arbeitsvorschrift gestaltet jedermann, selbst ohne jede rechnerischen Vorkenntnisse, sofort richtig zu rechnen. Für die Addition und Multiplikation dient die mit Pluszeichen versehene Seite, während für Subtraktion und Division die mit Minuszeichen bezeichnete Kehrseite dient.

Die Maschine gestattet einen ganz beliebigen Nach- oder Durchlängereintrag der verschiedenen Rechnungsarten. Am vorteilhaftesten eignet sich das System zur Addition und Subtraktion und diese wieder in Wechselwirkung, wie es die Staffelrechnung des Bankiers oder die Konto-Korrekturrechnung des Kaufmanns erfordert.

Das eigentliche Rechenmittel der Maschine ist eine Anzahl Rechenschieber, welche unterhalb sog. Kolonnenabschlüsse verschiebbar angeordnet sind. Jede Rechenseite besitzt eine Stellenzahl entsprechende Anzahl Kolonnenabschlüsse, welche an der einen Seite die senkrechte übernainante angordneten Zahlen 0—9 tragen. Neben jeder Zahl befindet sich ein Loch, welches dann auf dem entsprechenden Zeichenabschluß der jeweiligen Zahlenreihe gegen den begrenzenden oberen oder unteren Anschlag zuschlägt. Der obere Anschlag (B) liegt am Ende einer krückenförmigen Umbrückung des Kolonnenabschlusses, durch welche Anordnung jeden vollständigen Umlaufs der Ziffernschaltung bewirkt wird. Das Resultat ist jeweils in den oberhalb des Zahlenfeldes angebrachten Schaulöchern ablesbar.

Das Rechnen selbst geschieht durch einen Stift, welchen man in das Loch neben der zu rechnenden Zahl senkrecht einführt und den beweglichen Locheschieber gegen den unteren (A) oder oberen Anschlag (B) des Kolonnenabschlusses mit leichtem Druck zu führen. Siehe Skizze! Welcher der beiden Anschläge jeweils der richtige ist, d. h. genommen werden muß, zeigt die Markierung des Feldes, in dem das Loch liegt, und somit kommen wir zu unserer einfachen Regel für alle Rechnungsarten:

Liegt das Loch im „weißen“ Feld, so führt es der Stift stets nach dem oberen Schaltanenschlag (B), liegt das Loch im „roten“ Feld, so zieht man stets gegen den unteren Anschlag (A). Erscheint zwischen einem Blindfenster, so wird von Null aus nach dem oberen Anschlag (B) umgefahren, wodurch die richtigen Zahlen im resultatenfenster erscheinen.

Die Zahleinstellung geschieht am zweckmäßigsten so wie man diesselben spricht. Es ist bei dem Additor ganz einfacher, ob man von rechts nach links oder umgekehrt oder gar durcheinander einstellt, wenn nur an sich die richtige Zahl eingestellt wird.

Zum Zahlenlöschern befindet sich über der Platte ein Nullschieber, der herausgezogen alle Zahlenfenster auf Null stellt und hierauf wieder ganz eingesetzt wird.

Beispiel 3. Staffelrechnung.
Credit 619 200,50 man ziehe die Zahl auf der Platte
Debet -450 000,- man subtrahiere die Zahl auf der Minusseite
Credit -169 200,50 und erhält vorstehenden Saldo
Credit -233 721,16 man addiere wiederum auf der Platte
Credit -402 921,66 und erhält vorstehenden Saldo
Credit -700 000,- man addiere vorstehende Zahl auf der Platte
Credit I 102 921,66 und erhält vorstehenden Saldo
Debet -20 250,- man subtrahiere die Zahl auf der Minusseite
Credit I 082 503,34 und erhält vorstehenden Saldo
Debet -168,32 man subtrahiere wiederum auf der Minusseite
Credit I 082 671,66 und erhält vorstehenden Saldo
Debet -651 488,75 man subtrahiere auf der Minusseite
Credit -431 014,59 und erhält vorstehenden Saldo.

Beispiel 4. Die Maschine korrigiert sich bei falscher Bedienung selbsttätig.
Man stelle ein:
+ 996,00
+ 4,16 die in rot stehende 4 wird fälschlich nach unten gezogen, es erscheint ein Blindfenster, man addiere ohne es zu beachten weiter
+ 432,25
+ 1 432,41 und erhält vorstehendes richtiges Resultat.

Beispiel 5. Beispiel für eine Übertragungssperre des oberen Anschlags, wenn Blindfenster nicht vorschriftsmäßig beseitigt ist.
Man stelle ein:
+ 789,99
+ 000,32 bei dem Addieren der 3 entsteht im Eineraufstand der 9 ein Blindfenster. Beseitigt man dieses nicht und addiert weiter,
z. B. + 000,89 so läßt sich die 9 nicht mehr umrücken, d. h. der Übertrag ist gesperrt, die 9 steht
791,20 man dann das Blindfenster von der „1“ aus hoch und erhält somit wieder das richtige Resultat.

Beispiel 6. Die Beseitigung der Blindfenster am Schlusse der Rechnung.
Man addiere folgende Zahlen ohne Rücksicht auf dabei entstehende Blindfenster:
72 796,06 - 7 250,00 - 9 055,00 = 8,95.
Man erhält ein Resultat mit 3 Blindfenstern, die man von links anfangend vorschriftsmäßig beseitigt, dabei evtl. entstehende neue Blindfenster müssen ebenfalls beseitigt werden. Es erscheint das Resultat: 89 119,01.

Beispiel 7. Multiplikation. Hauptsatz ist für die Praxis als zweckmäßig empfohlen.
Um multipliziert nach dieser Art schmäler als gewohnt, nur mit dem Unterschied, daß man stets die Einzelergebnisse der Kopfmultiplication, ansatz auf Papier zu schreiben (um sie nacher zusammenzuaddieren), gleich auf dem Additor stellenrichtig einstellt, wobei das Produkt der Multiplikation automatisch im Resultatenfenster erscheint. Z. B. wie folgt:

$$\begin{array}{r} 36,5 \times 1625 \\ \hline 5 \times 1025 \\ 5 \times 5 = 25 \text{ erste Stelle} \\ 5 \times 2 = 10 \\ 5 \times 0 = 0 \\ 5 \times 1 = 5 \\ \hline \text{Resultatenfenster zeigt } 8125 \end{array}$$
dazu 6×1025

$$\begin{array}{r} 6 \times 5 = 30 \text{ zweite Stelle} \\ 6 \times 2 = 12 \\ 6 \times 0 = 0 \\ 6 \times 1 = 6 \\ \hline \text{Resultatenfenster zeigt } 105025 \end{array}$$
dazu 3×1025

$$\begin{array}{r} 3 \times 5 = 15 \text{ dritte Stelle} \\ 3 \times 2 = 6 \\ 3 \times 0 = 0 \\ 3 \times 1 = 3 \\ \hline = 593125 \end{array}$$
Ein Komma abgestrichen = 59312,5 das Endprodukt.

Etwaige Fehler in der Handhabung werden dem Rechnenden automatisch angezeigt, so daß er sich sofort verbessern kann. Es gibt nur 3 Möglichkeiten Fehler zu machen und diese zu beseitigen:
1. Wenn entgegen der Vorschrift in falscher Richtung gezogen wird, so zeigt eine eintretende Hemmung bzw. Unmöglichkeit an den Anschlag zu kommen, daß man verkehrt gearbeitet hat. Ein Zurückziehen an den andern Anschlag korrigiert sofort das Resultat.
2. Wenn bei falscher Bedienung ein Blindfenster eintritt, so korrigiert sich die Maschine von selbst durch das vorschriftsmäßige Beseitigen dieses Blindfensters. (Hierzu Beispiel 4.)
3. Wenn man aus Versehen eine falsche Zahl gezogen hat oder man will eine oder mehrere Zahlen aus der Rechnung ausschalten, so werden dieselben auf dem rückwärtigen Rechenwerk gezogen, womit sie prompt aus der Rechnung verschwinden.

Als praktischer Wink möge noch beachtet werden, daß man in den meisten Fällen ohne Rücksicht auf etwaige Blindfenster einfach weiter rechnen kann, da dieselben beim Weiterrechnen in den meisten Fällen wieder von selbst verschwinden. Man kann sich auf diese Weise das jedesmalige Beseitigen ersparen. Dies trifft zu, solange keine Übertragungssperre damit verbunden ist (Sperrre des oberen Anschlags). In diesem Falle beeinflusst man entweder vorschriftsmäßig vorher das Blindfenster oder aber man kann ausnahmsweise das Blindfenster auch von der „1“ aus hochziehen, wenn der Übertrag schon gesperrt ist und rechnet dann weiter. (Hierzu Beispiel 5.)

Die Blindfensterregel heißt also:

Solang ein Blindfenster keinem Übertrag im Wege steht, braucht es erst am Schluss der Rechnung beseitigt zu werden. Zeigt das Schlussresultat mehrere Blindfenster, so werden dieseben von links bei der höchsten Stelle anfangend in üblicher Weise beseitigt, womit das richtige Resultat freigegeben wird. (Hierzu Beispiel 6.)

Bei Staffelrechnungen kann es vorkommen, daß von einer kleineren Zahl eine größere abgezogen werden soll. Man stellt alsdann stets die größere Zahl auf der Platte ein und zieht hiervon die kleinere auf der Minusseite ab.

Arbeitsbeispiele.

Man legt die Maschine auf die zu addierenden oder zu subtrahierenden Zahlen und läßt immer nur die zu rechnenden Zahlen am Rande des Anschlags oben an der Maschine hervortreten. Es ist darauf zu achten, daß die Maschine vor Beginn der Rechnung auf Null eingestellt ist.

Beispiel 1. Addition.
Bei der Addition kommt die mit Pluszeichen versehene Seite des Additors in Anwendung.
Einstellen des Betages: M. 136,50.

Man stellt die Zahlen entweder der Reihe nach ein, oder — und das ist am zweckmäßigsten — wie man sie ausspricht. In diesem Falle also: einhundert-sechs- und-dreißig fünfzig Pfennige. Man ziehe also die Zahlen in den entsprechenden Schlitten nacheinander herunter, da sie sämtlich im weißen Felde liegen. Die Null ist natürlich nicht mehr zu ziehen, da sie bereits gezogen ist.
Addieren der „M.“ 33 495,27.

Man ziehe wiederum wie gesprochen, und zwar werden drei- und dreißigtausend - vierhundert, da sie im weißen Feld liegen, nach unten gezogen, die 9 ist über 8 weiß, da rot, an den oberen Anschlag geführt und umrückt, die beiden Dezimalstellen - 2 und - 3 werden, da weiß, wiederum nach unten gezogen. Es erscheint die Zahl: 33 634,77.

Beispiel 2. Subtraktion.
Man verfährt folgendermaßen: Nach vorheriger Nullstellung ziehe man wie vorher die Zahl 136,50 und drehe den Apparat auf die Minusseite. Dort ist jeden Schaulöchern ebenfalls die Zahl 136,50 ersichtlich.

Beispiel 8. Division.
Bei der Division kommt die mit Minuszeichen versehene Seite in Anwendung.
Man dividiere: 7840 : 17.

Man stellt die Zahl auf der Platte ein und reche auf der Minusseite weiter. Wie beim schriftlichen Rechnen ziehe man von der höchsten Stelle anfangend — in diesem Falle von 78 — solange den Divisor ab, bis die oben erscheinende Zahl kleiner ist als der Divisor, in diesem Falle kleiner als 17. Es erscheint nach 4 maligem Abziehen die Zahl 10, also eine kleinere als 17.
78 : 17 = 4 Rest 10.

Als 1. Stelle des Quotienten notiere 4
Zu dem Rest 10 ziehe man die nächste Stelle hinzu — 4, und dividire
nun 104 : 17. Nach 6 maligem Abziehen bleibt der Rest 2.
104 : 17 = 0 Rest 2.

Als 2. Stelle des Quotienten notiere 6
Zu dem Rest 2 ziehe man wiederum die nächste Stelle hinzu = 0, und dividire nun 20 : 17. Nach 1 maligem Abziehen bleibt der Rest 3.
20 : 17 = 1 Rest 3.

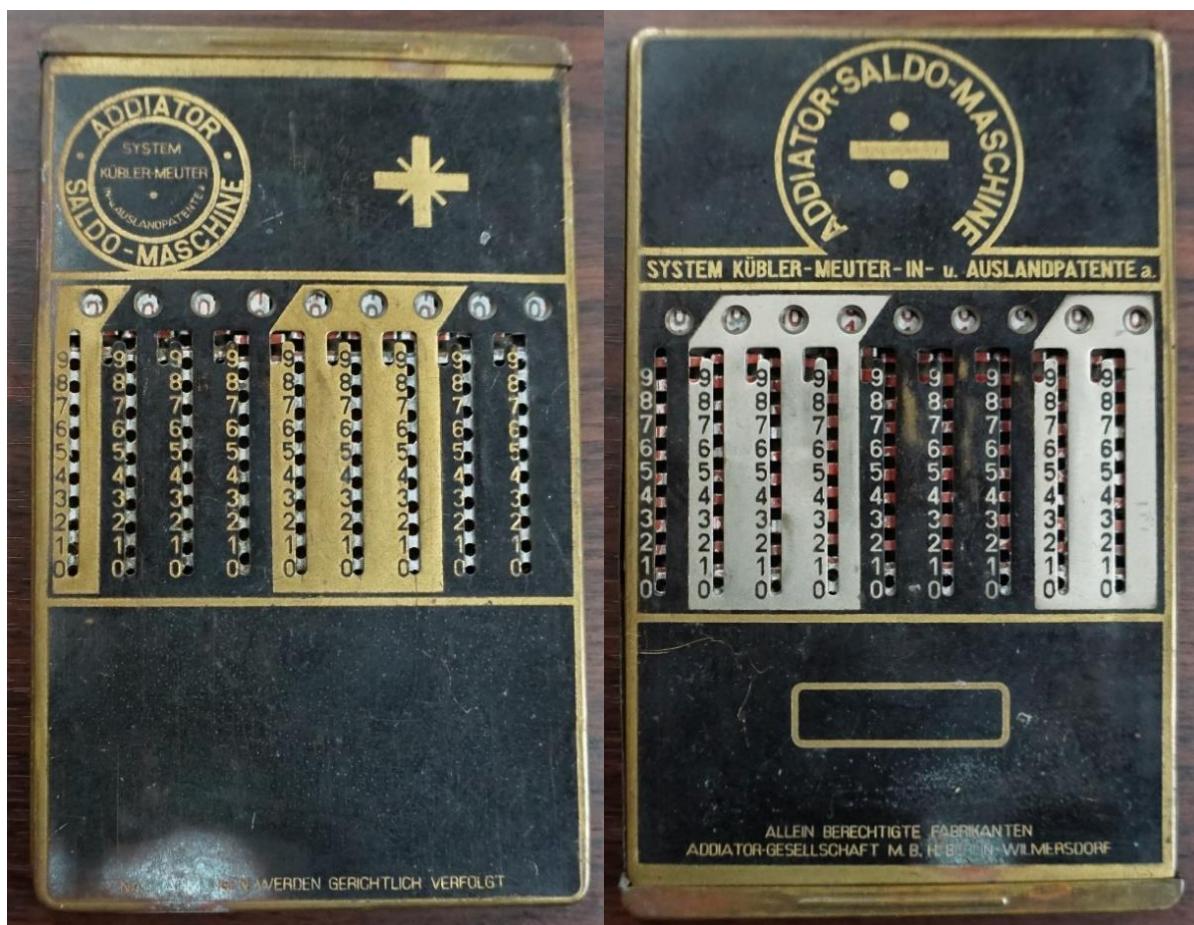

Als 3. Stelle des Quotienten notiere 1
Da die nächste Stelle schon die erste Dezimalstelle ist, muß nach der 1, wie bei jeder Division, das Komma gesetzt werden. Man ziehe nunmehr die Dezimalstelle hinzu = 0, und dividire nunmehr 3,0 : 17. Nach 1 maligem Abziehen bleibt der Rest 13.
3,0 : 17 = 1 Rest 13.
Als 1. Dezimalstelle notiere 1
Man dividire weiter:
13,0 : 17 = 0 Rest 11
Als 2. Dezimalstelle notiere 1
3,0 : 17 = 0 Rest 11
Resultat: 7840 : 17 = 461,17

Beispiel 9. Gemischte Rechnung.
Man rechne folgende Zahlen:

$$\begin{array}{r} 5 \cdot 467 533,50 + 2 368 274,75 - 7 535 808,25 - 60 000 = 624. \\ 5 \cdot 11 800 - 5 240,35 + 322 460,90 + 1 080,45 - 300 101 \end{array}$$
Man addiere und subtrahiere die Zahlen des Zählers, ebenso die des Nenners. Nun dividiert man diese beiden Zahlen nach Beispiel 8, gibt 12, welche Zahl nach Beispiel 7 multipliziert 624 ergibt.

The calculator lexicon (https://www.rechnerlexikon.de/artikel/Addiator_Basismodell) contains a representation of the Basic model in its original design. In contrast to R337, there were no colour differences in the columns and the values in the results row were only grouped by /. The first adverts were based on this design.

R337 ADDIATOR Basic model System KÜBLER-MEUTER Saldo-Maschine SN B024708

Patent DE367599 was filed with the patent office on 24 May 1919. The patent for the double-sided slide adder was not released until 23 January 1923.

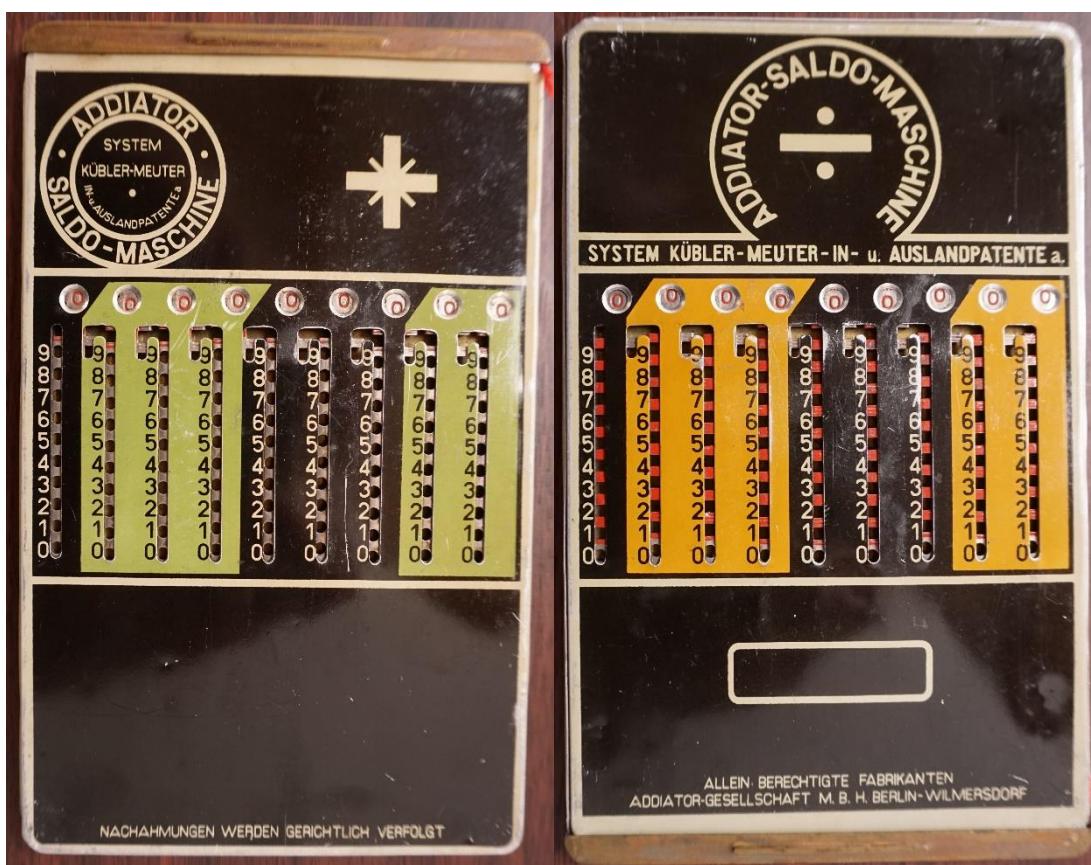

To discourage imitators, the imprint Nachahmungen werden gerichtlich verfolgt and on the reverse side Allein berechtigte Fabrikanten ADDIATOR-Gesellschaft m.b.H. Berlin Wilmersdorf.

Production started in August 1920 and a major order for Australia/New Zealand for 100,000 units enabled a successful start. By the end of 1921, 20,000 had been delivered for the major order. A further 8,000 units went to Germany and 5,000 to the rest of the world.

A D was placed in front of the serial number for the aluminium version and a B was placed in front of the serial number for the brass version.

From the number range between serial number 27,000 and 28,000, the Kübler-Meuter system was dispensed with, in line with the previously documented judgement.

1921 published: From Illustriertes ORGA-Handbuch erprobter Büro-Maschinen / II. Abschnitt
Rechenmaschinen edition greis Seite 213-214

Die Addiator-Taschen-Rechenmaschine

Genau so wie im vorigen Jahrhundert die Schreibmaschine ihren Siegeszug durch die Welt begann und allerorts die mit großem Zeitaufwand ausgeübte handschriftliche Erledigung von Schriftstücken verdrängte, hat sich heute die Rechenmaschine zu denjenigen Hilfsmitteln emporgeschwungen, die fast in keinem gut geleiteten Betriebe entbehrt werden können. Daß der Wert der Rechenmaschine noch nicht überall so bekannt ist, wie der der Schreibmaschine, liegt zumeist daran, daß manche auf dem Markt befindlichen Systeme im Gebrauch enttäuschten und dem Rechner, der erhebliche Erleichterung zu finden hoffte, wiederum gewisse Mühe und Unbequemlichkeiten anderer Art verursachten. Eine Rechenmaschine für den täglichen Gebrauch der Allgemeinheit, für billiges Geld zu haben, jedoch den weitestgehenden Ansprüchen genügend, zuverlässig und einfach in der Bedienung, leicht und handlich, fehlte bislang.

Diese Grundbedingungen in einer Maschine zu vereinigen, war das Bestreben der Addiator-Gesellschaft m. b. H., Berlin-Wilmersdorf, Brandenburgische Straße 41, als sie sich die Aufgabe stellte, eine praktische kleine Taschenrechenmaschine zu konstruieren.

Sie hat diese Aufgabe mit viel Geschick gelöst, denn die unter dem Namen „Addiator“ auf den Markt gebrachte Taschen-Rechenmaschine besitzt alle Eigenschaften, die man an ein praktisches Recheninstrument stellen muß. Sie hat den besonderen Vorzug, nach einer ganz einfachen Regel ohne weitere Vorkenntnisse bedient werden zu können. Ein handliches Format, in der Größe und in Gewicht einer Brieftasche, gestattet die ständige Mitführung dieses kleinen, hübsch ausgestalteten Maschinchens. Es wird nicht nur im Büro, sondern auch unterwegs auf Lagerplätzen, bei Warenverladungen, in Magazinen, auf dem Neubau, am Hafenplatz, im Bergwerk, auf dem Acker und in der Forst, ja selbst in der Eisenbahn rechnerische Arbeiten bequem erledigen und daher schnell ein unentbehrlicher Mitarbeiter und ständiger Begleiter sein.

Die „Addiator“-Taschen-Rechenmaschine arbeitet nach dem Pendelsystem und besitzt je ein zunehmendes und ein abnehmendes Rechenfeld. Beide Felder

213

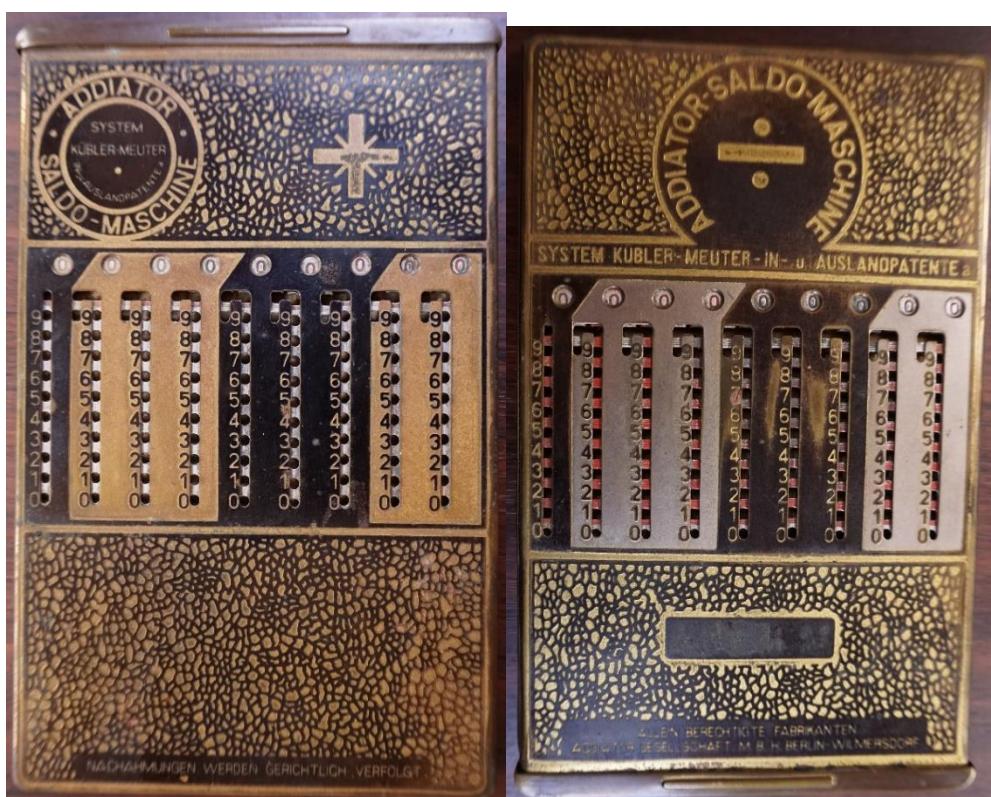

arbeiten zwangsläufig zusammen, wodurch eine völlig automatische Saldobildung ermöglicht wird, was für jede Buchhalterei von eminentem Wert ist. — Zwecks leichterer Übersicht sind die Zahlenstellen farbig abgeteilt, was für die Einstellung größerer Zahlenreihen von Vorteil ist.

Die Einstellung einer Rechenaufgabe geschieht mit einem Rechenstift (Bleistift mit Metallspitze), welcher senkrecht in die Öffnung neben der gewünschten Zahlenart eingesteckt wird und je nach der einzustellenden Zahl gegen den unteren oder oberen Anschlag bewegt wird. Zahlenlöcher auf weißem Grund werden stets nach dem unteren, die auf rotem Grund stets nach dem oberen Anschlag gezogen. Durch einfaches Hochziehen eines Metallbügels wird die in der Maschine befindliche Aufgabe gelöscht und die Maschine ist zur Aufnahme neuer Rechnungen bereit.

Der Vertrieb der „Addiator“ begann im August 1920. Die Gesellschaft hat innerhalb Jahresfrist weit über 100 000 Maschinen verkauft.

Alleinberechtigte Herstellerin der „Addiator“ - Taschenrechenmaschinen ist die Addiator - Gesellschaft m. b. H., Berlin - Wilmersdorf, Brandenburgische Straße 41.

R600 ADDIATOR Basic model System KÜBLER-MEUTER Saldo-Maschine SN M150098

This variant does not match the previous models:

The so-called M2f (brass) glass breakage pattern was used.

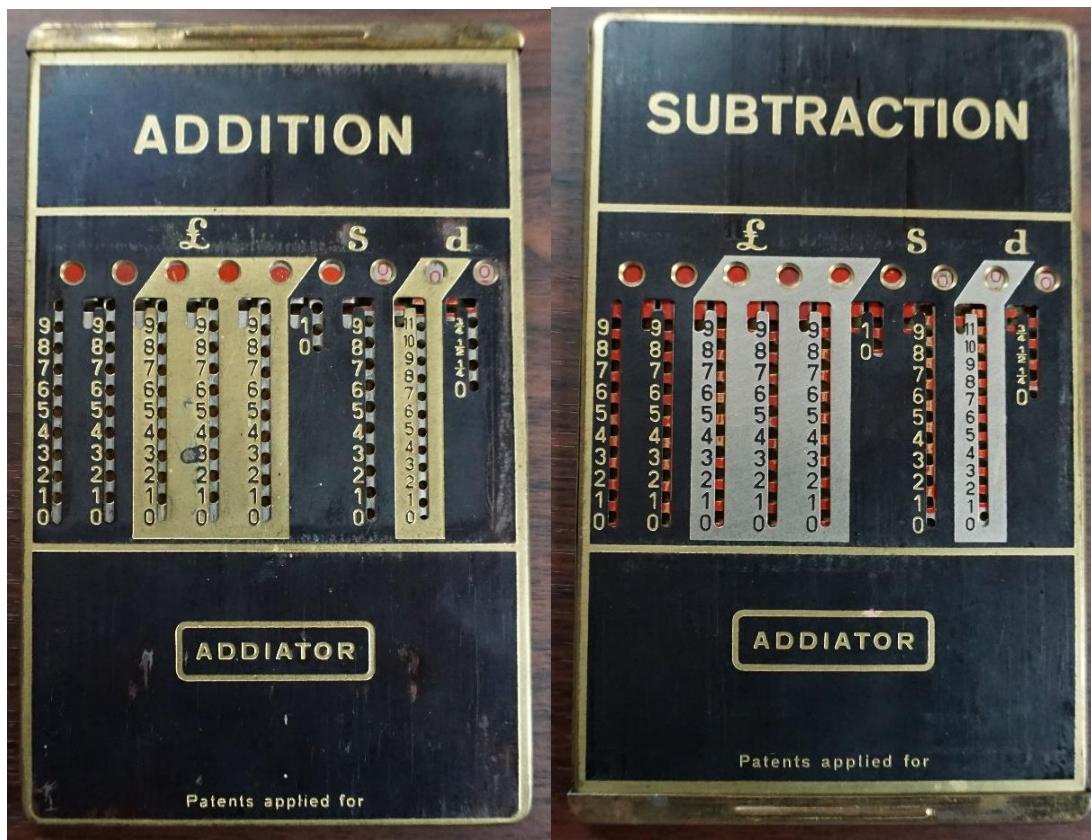

The serial number could refer to the 5th anniversary. Instead of D0..... / B0..... here M15....
So far, only a few identical-looking examples have been found, all beginning with M150, so a possible limitation to 1000 pieces.

The word ADDIATOR was protected by trademark WZ234374 on 12 December 1921.

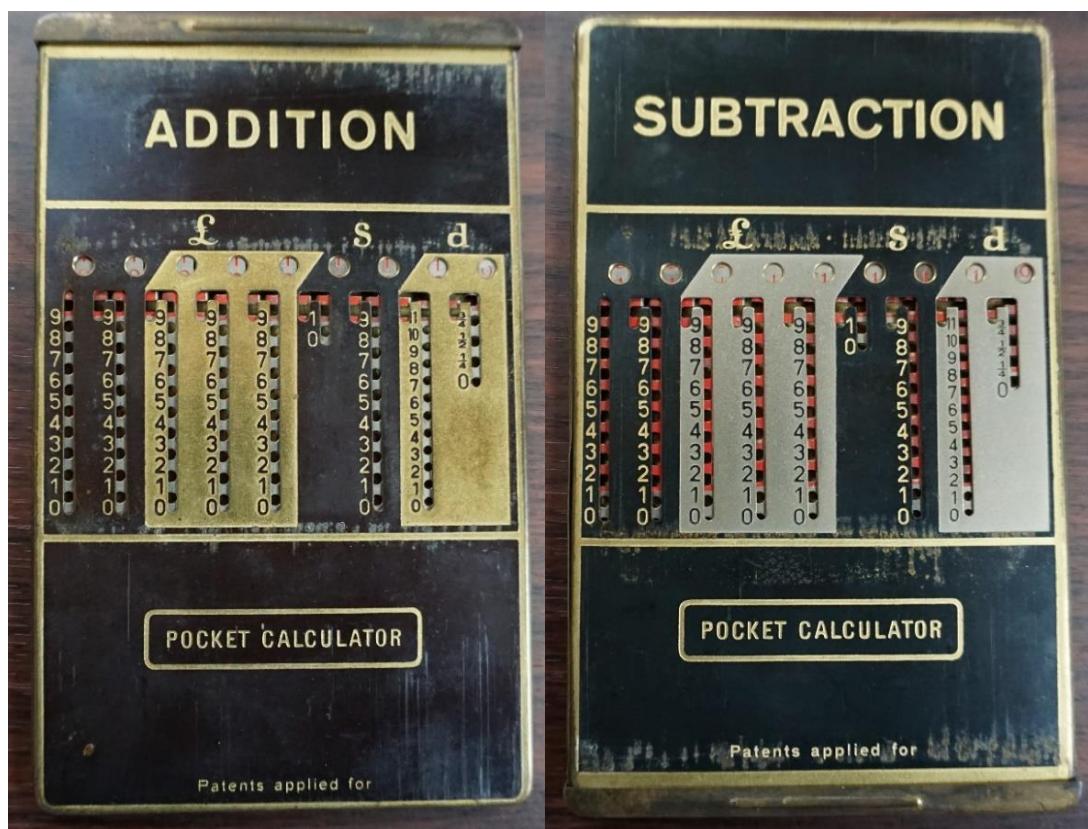

As the patent was not granted until the beginning of 1923, ADDIATOR protected the trade mark in the meantime with:

How to multiply with the ADDIATOR!

Wie man mit der ADDIATOR auch multiplizieren kann!

Multiplikation: (Additionsseite)

Man lege unter das Zahlenfeld ein Blatt Papier und notiere darauf die zu multiplizierende Zahl in der Weise, daß die Zahlenabstände genau denen der darüber befindlichen Kolonnen entsprechen. Die Zahl, mit der multipliziert werden soll, wird dann wie beim schriftlichen Rechnen von rechts beginnend wie folgt unter die andere gesetzt.

Beispiel:

$$\begin{array}{r} \dots\dots\dots\dots\dots\dots\dots \\ * * * * * * * \\ & & & 7 & 6 & 4 & 9 \\ & & & \times & & 3 & 4 \end{array}$$

Zunächst multipliziere man wie üblich $4 \times 9 = 36$ und zieht die 36 in die Maschine ein. Dann folgt $4 \times 4 = 16$. Nachdem alle Multiplikationen mit 4 ausgeführt sind, rückt man das Blatt um eine Stelle weiter nach links und rechnet nun in derselben Weise mit 3. Beim Einziehen des jeweiligen Teilproduktes in die Maschine ist der Rechenstift zuerst immer in die Spalte einzusetzen, welche sich genau über der gerade zu multiplizierende Zahl befindet. Also bei 4×9 kommt die 6 in die Kolonne über 9 und die 3 links daneben, bei 4×4 die 6 über die 4 und die 1 links von der 6 usw.

Endergebnis: 260 066

Division: (Subtraktionsseite)

Beispiel 8946 : 37

Man stellt die zu dividierende Zahl auf der Additionsseite, auf der linken Seite der Maschine beginnend ein. Dann dreht man die Maschine auf die Subtraktionsseite um und notiert die Zahl, durch die dividiert werden soll, auf ein unter die Kolonnen gelegtes Blatt Papier so, daß die 3 unter 8 und die 7 unter 9 zu stehen kommt. Hierauf wird wie beim schriftlichen Rechnen zunächst die 37 in 89 dividiert und das Teilresultat, also 2, aufgeschrieben. $2 \times 37 = 74$ zieht man alsdann in die Kolonne unter 89 ein, nach dem bei der Multiplikation beschriebenen Verfahren. Als Rest verbleibt 15. Danach wird das Papier eine Stelle weiter nach rechts gerückt, die 37 in 154 dividiert, die zweite Teilzahl 4 rechts neben die erste notiert und die Teilprodukte der Multiplikation von 37 mit 4 wie üblich in die Maschine unter 154 eingesogen. Nun folgt noch eine Division von 37 in 66 - 1. Das Endresultat ist 241 und in der Maschine verbleibt als Rest 29.

How to multiply with the ADDIATOR!

Multiplication: (addition page)

Place a sheet of paper under the number field and write down the number to be multiplied on it so that the distances between the numbers correspond exactly to those of the columns above. The number to be multiplied is then placed under the other as follows, starting from the right as in written calculations.

Example: 7649×34

First multiply $4 \times 9 = 36$ as usual and draw the 36 into the machine. Then $4 \times 4 = 16$. After all multiplications with 4 have been carried out, move the sheet one place to the left and now calculate with 3 in the same way. When entering the respective partial product into the machine, always insert the slider into the column that is exactly above the number to be multiplied. So for 4×9 the 6 is placed in the column above 9 and the 3 to the left of it, for 4×4 the 6 is placed above the 4 and the 1 to the left of the 6 and so on.

Final result: 260 066

Division: (subtraction side) Example $8946 : 37$

Set the number to be divided on the addition side, starting on the left-hand side of the machine. Then turn the machine over to the subtraction side and write down the number to be divided on a sheet of paper placed under the columns so that the 3 is under 8 and the 7 under 9. Then divide 37 into 89, as in written arithmetic, and write down the partial result, i.e. 2. $2 \times 37 = 74$ is then entered in the column below 89, using the method described for multiplication. The remainder is 15. Then move the paper one place to the right, divide 37 into 154, write down the second partial number 4 to the right of the first and enter the partial products of the multiplication of 37 by 4 into the machine under 154 as usual. Now divide 37 into 66 1. The final result is 241 and the remainder in the machine is 29.

The Basic model was also produced under other names, Original ADDIATOR, ADDIATOR Standard, until the end of 1960.

The 12-digit version (also S12) had serial numbers starting with P50/P55 (weak currency).

Production quantity for all models until the end of 1922 was about 60,000.

The glass breakage pattern is recognisable by an M in the serial number. The later serial numbers start without letters on the larger models. At the same time, the arrow symbol can be found instead of a red blank space.

ADDIATOR SUPRA
die Kleinrechenmaschine in höchster Vollendung.

The advertisement features two main sections. The top section, titled "ADDIATOR SUPRA", shows a closed dark leather case labeled "geschlossen!" and an open calculator with its components shown separately. The calculator has a small display and several numeric and function keys. The bottom section, titled "ADDIATOR MODELL S 12", shows a detailed diagram of the calculator's internal mechanism, including a grid of numbers and a small display. Below this is a photograph of the calculator itself, which is a rectangular device with a decorative front panel and a small display at the top. The text in the ad describes the precision work and elegant design of the calculators, their portability, and the guarantee period of 2 years.

„ADDIATOR - SUPRA“ ist das Produkt langjähriger Erfahrung auf dem Gebiete der Rechenmaschinenfabrikation. Sie stellt eine äußerst gediegene Präzisionsarbeit in vornehmer Aufmachung dar. Das mit der Maschine verbundene Klappstativ neuartiger Konstruktion ist elegant aus prima Saffianleder gefertigt und dient dazu, die Maschine beim Rechnen in bequemer Lage zum Auge und zur Bedienung zu halten. In der Ruhelage schützt es die Maschine vor Verstaubung und Beschädigung. Ein einfacher Handgriff genügt, um die Kombination wie eine Brieftasche flach zusammen zu legen, sodaß sie bequem in der Rocktasche untergebracht werden kann. Das Format ist alsdann $11 \times 18\frac{1}{2} \times 1\frac{1}{2}$ cm. 9 stellig, Messing geätzt, doppelseitig. RM. 48,-

2 Jahre Garantie!

ADDIATOR MODELL S 12

Spezial - Buchhaltungs- und Saldiermaschine nebst Fixator mit Debet- und Credit - Einrichtung

Ausführung: 12 stellig, Messing geätzt, doppelseitig, Format: $12 \times 18\text{cm}$ (mit oder ohne Pfennig-Einteilung!)

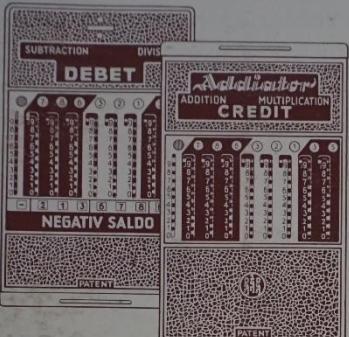

- a) auf Spritzguß - Stativ mit Gummifüßchen. RM. 49,- (siehe Abbildung unter M 2 f)

Fixator Resultat-Feststellungs-Vorrichtung mit Debet und Credit Einteilung für S 12 (lt. Abbildung) RM. 2,50

Note: A result fixing device has been attached to the ADDIATOR Basic model S12, it is not a new model.

ADDIATOR
mit Negativsaldo-Einrichtung („NEGATIV-ADDIATOR“)
Geschützt durch internationale Patente.

2 JAHRE GARANTIE!

Dieses Addiatormodell bietet geradezu unerschöpfliche Auswertungsmöglichkeiten. Sein Hauptprinzip beruht darauf, daß man beim Addieren und Subtrahieren mit der „Negativ-Addiator“ nicht nur, wie üblich, kleine Werte von größeren abziehen kann, sondern umgekehrt auch größere Werte von kleineren. Dabei ist zu beachten, daß der im letzteren Falle sich ergebende Saldo unter 0 (Negativsaldo) ohne Zwischenmanipulation ebenso einfach aus den unteren Resultatfenstern ablesen werden kann, wie der Saldo über 0 aus den oberen Resultatfenstern. Das ist bei keiner anderen Additions- und Subtraktions-Maschine möglich, und erspart das zeitraubende Umsortieren der Zahlen (nachträgliches Abziehen der kleineren von der größeren Summe).

A u s f ü h r u n g: 9 stellig, Messing geätzt, doppelseitig, Format: 12×18 cm.

Note: Putty and Perplex no longer on offer, instead ADDIATRIX and DUPLEX

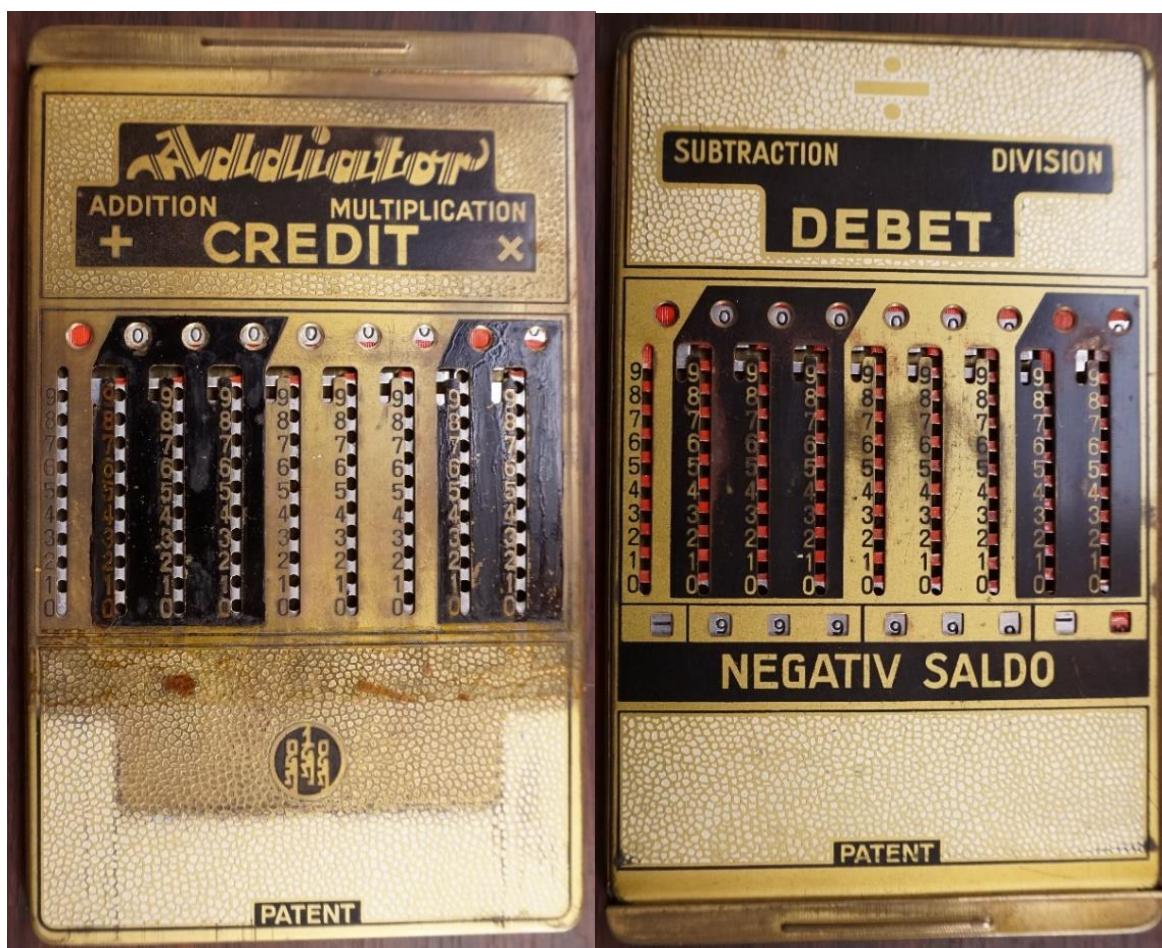

On 22 August 1930, ADDIATOR patented the calculation with a negative balance on Slide adder (DE586918).

When switching to the meander pattern, the name of the number slider was also changed. CREDIT DEBET only seemed interesting for accountants. ADDIATOR Negative was simple and generally usable.

For the currency Pound Sterling there was the variant Negative R532.

From the meander pattern, see R749, via the braid pattern, see R386, to the bar pattern, see R744, and finally in the +- pattern. The transformation took place over four decades. With the ADDIATOR Super with a new logo, a new model name was chosen. Negative balance is also shown on the Maximator, ADDIATOR Triplex, Addimax Triplex, Addimax Fractomator, ADDIATOR Universal and Klawun 9 Universal.

ADDIATOR Rechenmaschinenfabrik Berlin Charlottenburg Showcase

The Maximator Valorect was probably too complicated to handle. This is why only a few examples can be found.

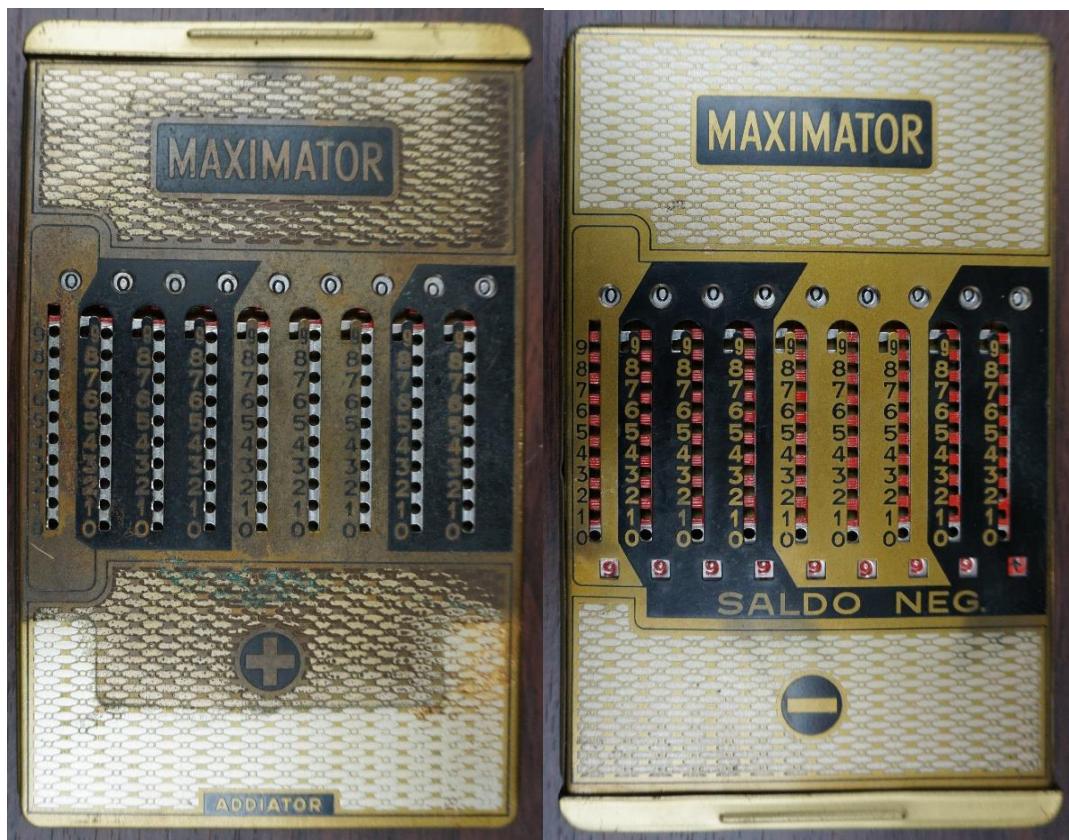

After the Second World War (1950-1962), the agent Aschenbrenner set up a sales organisation specifically for the Maximator model. The target group was craftsmen, for whom familiarisation and training was also offered. A special feature of the model was an integrated storage mechanism.

Of course, you could also use a normal duplex slide adder, but the back side of a storage mechanism was not required. See also duplex single-sided R429 and R684

Clichés

Apparently a new model, but identical in construction to the Basic model - the name Supra. The serial numbers for the variants without an arrow have an F in front of them. SUPRA was probably intended to replace the Basic model. As you can see from the Addiator original - unsuccessfully. During the 1930s, there was a lot of experimentation with different metals. The Rapid was the cheap model for many years.

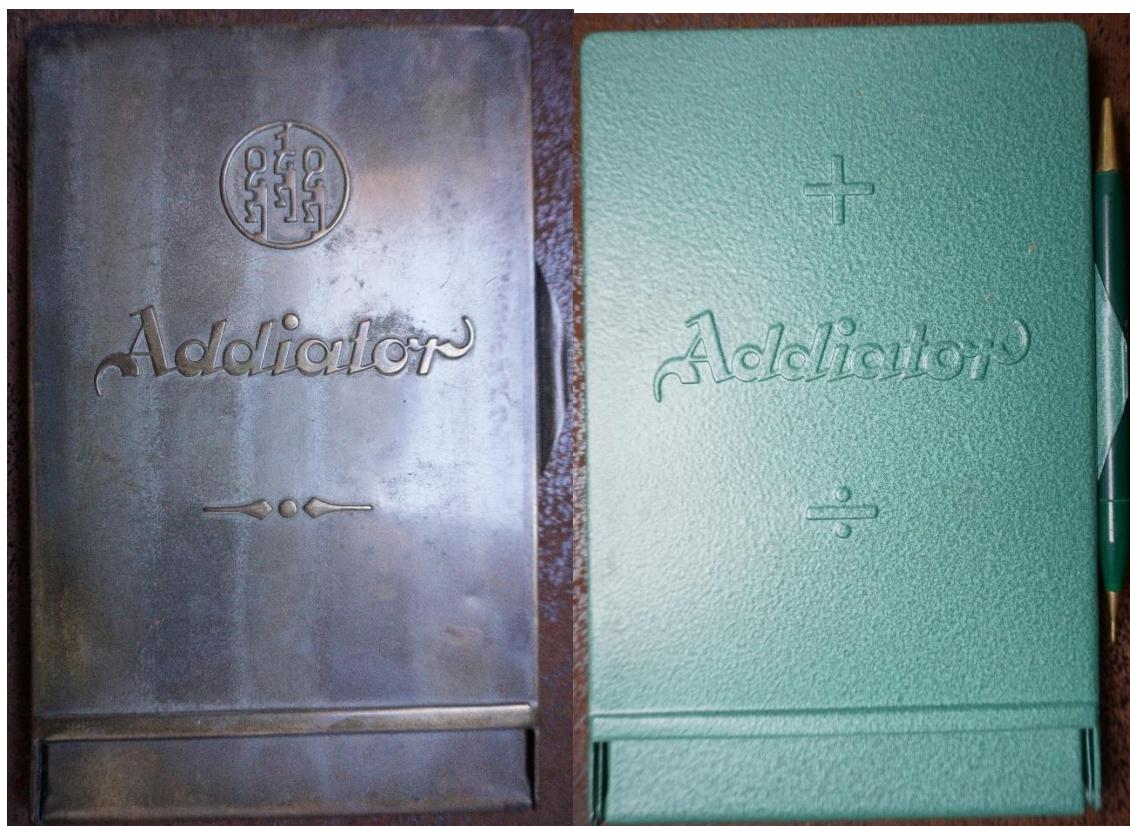

The following characteristics can be used to categorise all ADDIATOR models from around 1930 to 1950

To be found at:

- Addiator Basic model with arrow
- Addiator Rupee
- Addiator Negativ
- Addiator Supra
- Addiator Rapid

Further documents with new logo Instructions for use top left

The image shows an instruction manual for the ADDIATOR Duplex. The front page features a yellow note at the bottom left with the text: "Für den intensiven Dauergebrauch empfehlen wir unsere Messingmodelle ADDIATOR-Werk Wolfach/Baden". The main text on the front page is in German and describes the machine's operation for addition and subtraction. The back page contains a diagram of the ADDIATOR with labels for its parts: Nullsteller (Nullstelle), Resultatfenster (Resultatfenster), Anschlag „B“ (Anschlag „B“), Lochreihe (Lochreihe), and Anschlag „A“ (Anschlag „A“). It also includes illustrations of a correct and an incorrect insertion of a calculation rod.

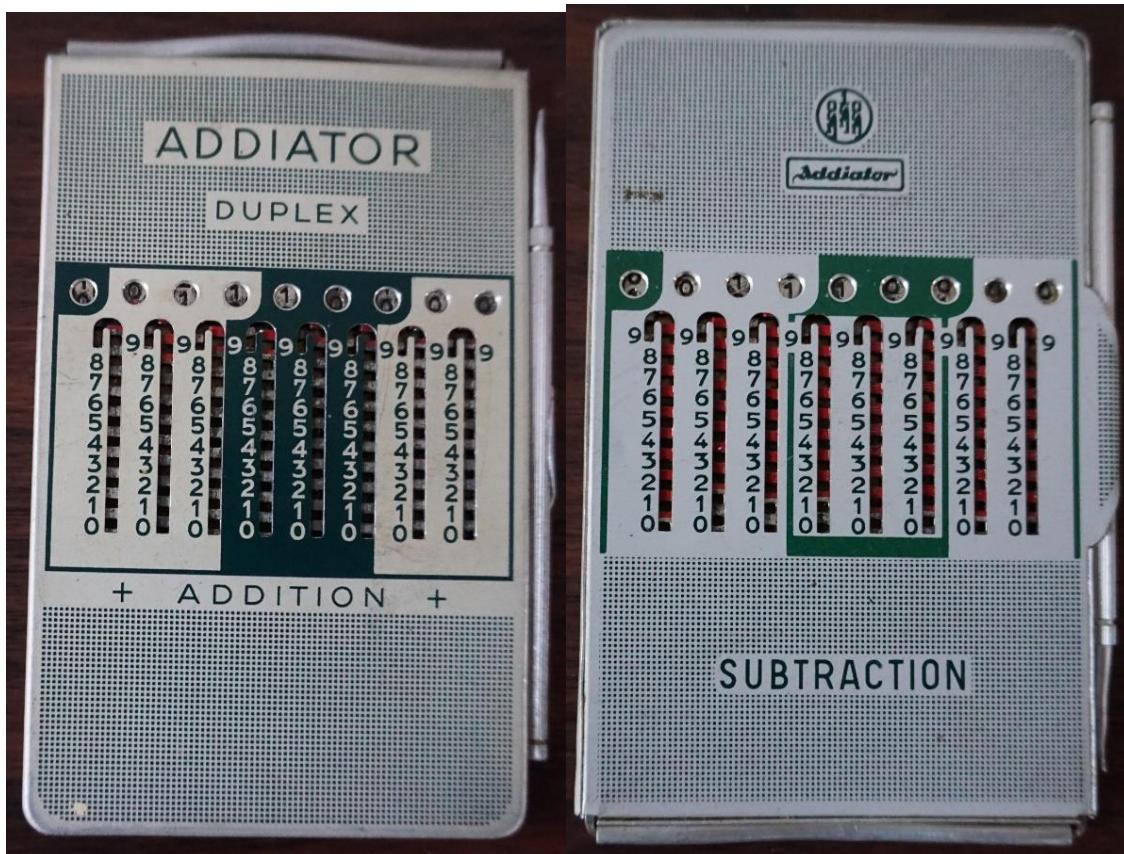

Vorderseite: ADDITION

Die Maschine ist sofort arbeitsbereit, wenn in allen oberen Resultatfenstern Nullen stehen. Ist dies nicht der Fall, ziehe man den Nullsteller ganz heraus und schiebe ihn wieder zurück. Pfeilsignale in den Resultatfenstern, die nach unten zeigen, werden beseitigt durch Einstecken des Rechenstiftes in das unterste Loch der unter dem Pfeil befindlichen Lochreihe und Hinunterziehen bis zum Anschlag „A“. Man beginnt zu rechnen, indem man die Metallspitze des Rechenstiftes senkrecht in das Loch neben der gewünschten Ziffer einsteckt und sie mit leichter Hand gegen den unteren Anschlag „A“ zieht. Nunmehr erscheinen Teile der Lochreihe in den Schlitten in Rot. Bitte, beachten Sie jetzt beim Weiterrechnen: Ziffern neben der hellen Lochreihe werden nach unten gezogen bis zum Anschlag „A“. Ziffern neben roten Lochreihen ziehe man mit dem Stift nach oben und umfahre den Bogen bis Anschlag „B“. Das Ergebnis ist sofort in den Resultatfenstern abzulesen.

RECHENMASCHINEN - FABRIK C. KUBLER

1920  1960

BERLIN-CHARLOTTENBURG
LEIBNIZSTR. 33 • (Britischer Sektor)

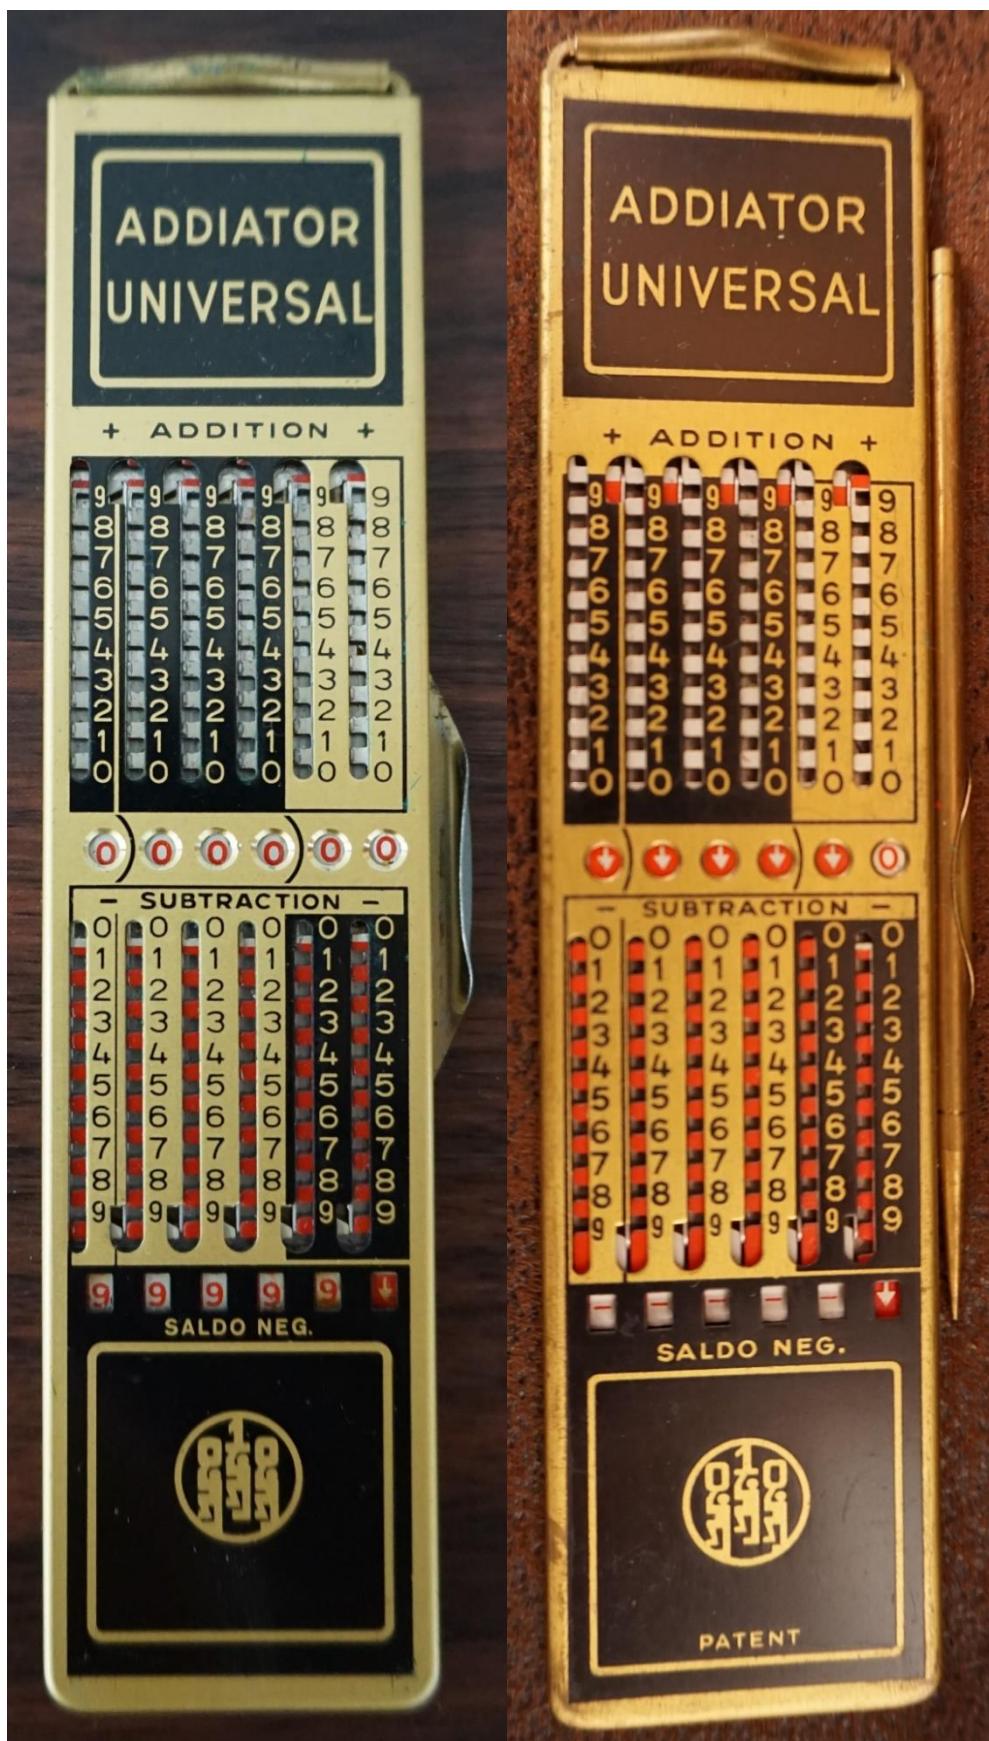

Magazine Heim und Welt 1960

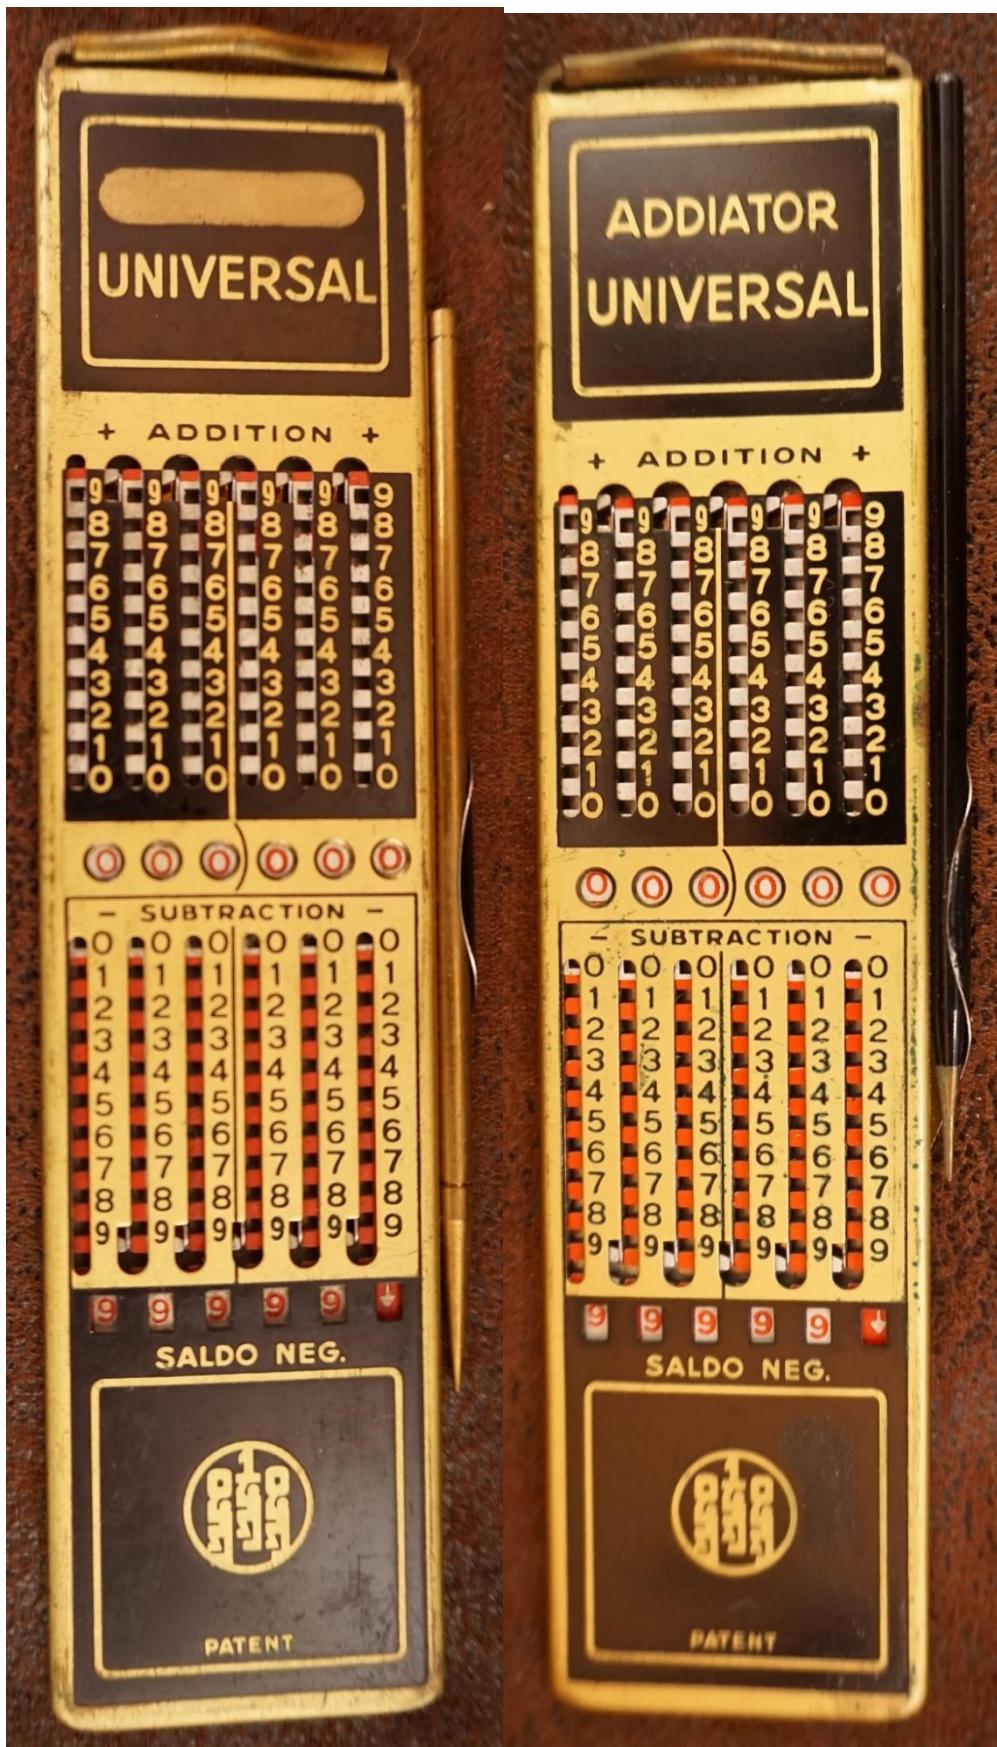

40 years ADDIATOR-Company

When Mr Carl Kübler developed the first ADDIATOR calculating machine in Febr. 1920 - the factory is still owned by the same family in West Berlin to this day - he had no idea how important these small precision machines would become in the age of technology. They are already exported to 92 countries. In the meantime, large and largest electric calculating machines have come onto the market. Today, the factory has a versatile production and is constantly working on the development of new models and combinations in order to meet all requirements, even in the course of progressive rationalisation.

50 years ADDIATOR

Carl Schaffhirt

50 Jahre ADDIATOR „Kleinrechenmaschinen“

Die Firma ADDIATOR Rechenmaschinenfabrik C. Kübler, 7620 Wolfach/Baden, blickt am 13. Februar auf ihr 50-jähriges Bestehen zurück. Der Gründer, Carl Kübler, ein gebürtiger Schwabe, erkannte früh die Notwendigkeit des maschinel- len Rechnens auch für kleinere Unternehmen, für Einzelkaufleute, Ärzte, Vertreter, für jeden, der zu rechnen hat und sich keine große teure Maschine anschaffen kann oder will. Diese Kleinrechenmaschine mußte einfach zu bedienen sein, schnell und zuverlässig arbeiten, möglichst in jede Tasche passen und für jedermann erschwinglich sein. Angeregt durch die „Napiersehs Stäbchen“, eine frühere österreichische Erfindung, entwickelte Carl Kübler das heute in aller Welt verbreitete ADDIATOR-System, für das er zahlreiche in- und ausländische Patente erhielt. In späteren Jahren folgten Gebrauchsmuster und weitere Patente. Für die Ergänzung des ADDIATOR-Systems durch Einbauen der Negativ-Saldo, für die Kombination ihrer Geräte mit einem Rechenschieber etc. folgten weitere Patente.

Die ersten 25 Jahre wurde die von Carl Kübler in Berlin gegründete Firma von ihm selbst geleitet. Der Krieg brachte schwere Verluste; die Zweigfabrik im Süddeutschland, das Büro- und Wohnhaus in Westberlin, starke Schäden an den restlichen Fabrikationsräumen in Berlin-Charlottenburg.

1945 übergab Carl Kübler die Firma seiner Tochter und Mitarbeiterin Frau Margot Schaffhirt-Kübler, welche die ersten 5 Jahre nach dem Zusammenbruch gemeinsam mit einigen langjährigen Mitarbeitern die Firma wieder aufbaute und sie seit 1950 zusammen mit ihrem Ehemann Carl Schaffhirt leitet. Wesentlichen Anteil an der Entwicklung nahm 46 Jahre lang der Prokurator der Firma Ernst Schweder — vielen Fachhandelskunden von den Messen in Leipzig, Frankfurt und Hannover bekannt. Dieser mußte leider aus gesundheitlichen Gründen vorzeitig in den Ruhestand treten, steht aber weiterhin der Geschäftsleitung beratend zur Seite.

Carl Friedrich Kübler

Margot Schaffhirt-Kübler

Durch den in Stuttgart geborenen Gründer der Firma bestanden von jeher enge Beziehungen zu süddeutschen Geschäftsfreunden. 1958 wurde in Wölfach/Baden eine Zweigstelle errichtet. 1963 wurde der Hauptsitz der Firma dorthin verlegt, während in Westberlin eine Zweigstelle mit Auslieferungslager weiterbesteht.

Schon das erste ADDIATOR-Modell, Addition auf der Vorderseite, Subtraktion auf der Rückseite stellig in der Größe: $17 \times 12 \times 1$ cm fand viele Freunde von Deutschland bis Neuseeland. In den nachfolgenden Jahren wurden zahlreiche weitere Modelle entwickelt, nicht nur für das Dezimal-System, sondern auch für sämtliche von diesem System abweichenden Währungen der Welt, ferner für englische Maße und Gewichte, für Zeitberechnungen, ein Code-Modell, welches auf der einen Seite Buchstaben zeigt und auf der anderen die entsprechenden entschlüsselten Zahlen. Als neuestes wurde ein sog. „Computer“ Modell „Hexadda“ herausgebracht, welches nach dem hexadezimalen System arbeitet, dessen sich viele moderne EDV-Anlagen bedienen. Damit gibt es heute 20 verschiedene ADDIATOR-Modelle in unterschiedlichen Aufmachungen.

In den letzten 20 Jahren erweiterte die Firma ADDIATOR ihr Fabrikationsprogramm durch einige Büro- und Organisationsgeräte, wie fahrbare Postverteiler, neuartige Stempelhalter und ihr Disponent-Sichtregister.

Die verschiedenen ADDIATOR - Rechengeräte fanden im Laufe der Jahre viele Millionen Freunde in Deutschland und in über 90 anderen Ländern. Billige Imitationen konnten das Vorbringen der Original-ADDIATOR-Rechengeräte auf dem Weltmarkt nicht verhindern, weil einerseits unbearbeitet das Qualitätsprinzip im Vordergrund steht, andererseits kein Unternehmen auf der Welt deirant auf die Herstellung von Kleinst-Rechenmaschinen spezialisiert ist.

Ernst Schweder

50 years of ADDIATOR small calculating machines

The company ADDIATOR Rechenmaschinenfabrik C. Kübler, 7620 Wolfach/Baden, looks back on its 50th anniversary on 13 February. The founder, Carl Kübler, a native of Swabia, recognised early on the need for automatic calculating machines for smaller companies, sole traders, doctors, sales representatives, for anyone who has to calculate and cannot or does not want to buy a large, expensive machine. This small calculating machine had to be easy to use, work quickly and reliably, fit into any pocket and be affordable for everyone. Inspired by the "Napierschen Stäbchen", an earlier Austrian (note: Austria is a misnomer, the inventor was John Naper, a Scot) invention, Carl Kübler developed the ADDIATOR system, which is now widely used all over the world and for which he was granted numerous domestic and foreign patents. Utility models and further patents followed in later years. Further patents followed for the addition of negative balances to the ADDIATOR system, for the combination of their devices with a slide rule, etc.

Picture top left Carl Friedrich Kübler

For the first 25 years, the company founded by Carl Kübler in Berlin was managed by himself. The war brought heavy losses: the branch factory in the Sudetenland, the office and residential building in West Berlin, severe damage to the remaining factory premises in Berlin-Charlottenburg. In 1945, Carl Kübler handed the company over to his daughter and employee Mrs Margot Schaffhirt-Kübler, who spent the first 5 years after the collapse rebuilding the company together with a number of long-serving employees and has managed it together with her husband Carl Schaffhirt since 1950. For 46 years, Ernst Schweder, the company's authorised signatory, played a major role in the company's development and was known to many trade customers from the trade fairs in Leipzig, Frankfurt and Hanover. Unfortunately, he had to retire early for health reasons, but continues to support the management in an advisory capacity.

The founder of the company, who was born in Stuttgart, has always maintained close relations with business friends in southern Germany. In 1958, a branch office was established in Wolfach/Baden. In 1963, the company headquarters were relocated there, while a branch office with a distribution centre continued to exist in West Berlin.

Even the first ADDIATOR model, addition on the front, subtraction on the back side, in the size: 17 x 12 x 1 cm, found many friends from Germany to New Zealand.

Picture top right Carl Schaffhirt

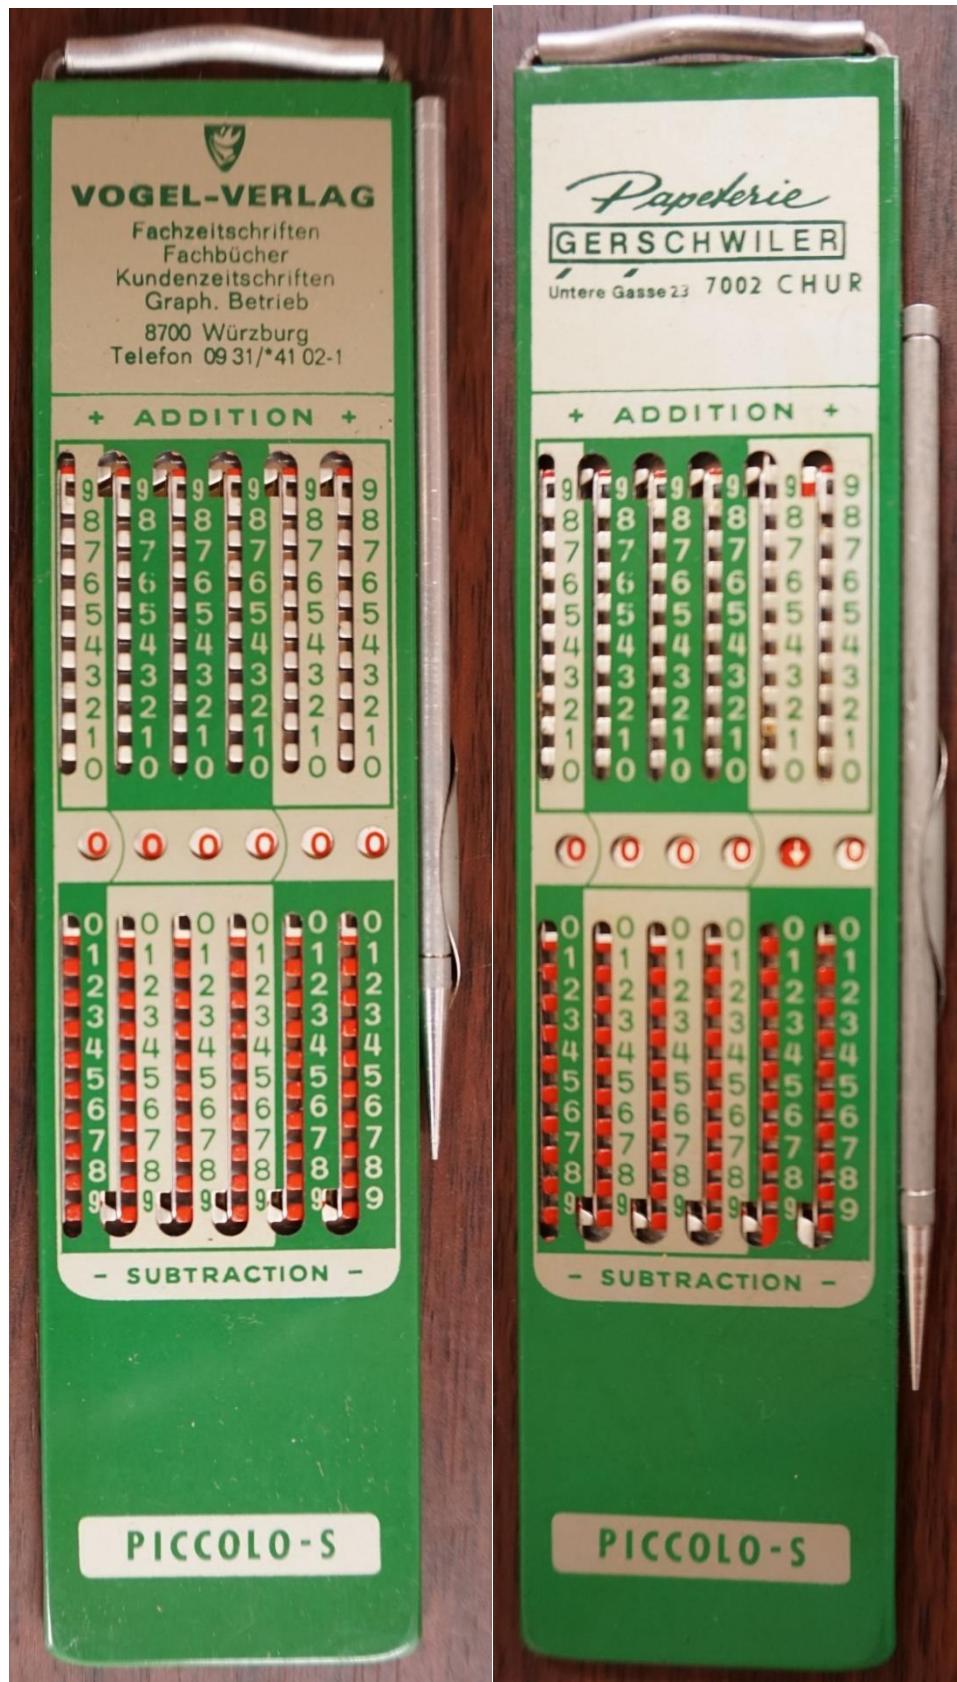

In the years that followed, numerous other models were developed, not only for the decimal system, but also for all the currencies in the world that deviated from this system, as well as for English weights and measures, for time calculations, a code model showing letters on one side and the corresponding decoded numbers on the other. The latest addition is a so-called "computer" model "Hexadat", which works according to the hexadecimal system used by many modern computerised systems. Today there are 20 different ADDIATOR models in various designs.

Over the last 20 years, ADDIATOR has expanded its product range to include a number of office and organisational devices, such as mobile mail distributors, innovative stamp holders and its Disponator visual register. Over the years, the various ADDIATOR calculators have made millions of friends in Germany and over 90 other countries. Cheap imitations were unable to prevent the original ADDIATOR calculators from penetrating the world market because, on the one hand, the principle of quality remained unwavering and, on the other, no other company in the world specialised in the manufacture of miniature calculators to such an extent.

R807 ADDIMAX HEXADAT Development pattern Comparison with HEXadder

ADDIATOR sent a Hexadat sample to the USA. The information reached the HEXCO company via nebulous channels, which then launched a very similar slide adder on the market, but did not receive a patent for it. However, production of the HEXadder could not be stopped. The HEXadder variant shown here does not contain a patent notice. The R855 variant shown later bears the note Patent Pending.

The modern programmer's cutlery

*Das Besteck
des modernen
Programmierers*

*Programmer's
Tool-Bag
up to date*

Programmierer sind keine billigen Arbeitskräfte — es sind wertvolle Mitarbeiter, von deren Leistungen vieles abhängt.

Jede Erleichterung macht sich mehrfach bezahlt, spart viel Zeit und steigert die Arbeitsfreude.

Alle diese Voraussetzungen erfüllt das neue Programmier-Set. In einer schwarzen Ledertasche, verschließbar und mit Reißverschluß, sind die wichtigsten „Werkzeuge“ enthalten:

- 1 ADDIATOR-Hexadat für hexadezimale Additionen und Subtraktionen und 2er Komplement,
- 1 ADDIATOR - Universal - Lux für dezimales Rechnen, 1 Tabelle hexadezimal von $n \cdot 10^0$ bis 16^7 und decimalhexa von $n \cdot 10^0$ — 10^9
- 1 Rechenstab Faber-Castell, Rietz oder Disponent, 1 Zeichenstift — 0,5 mm Faber-Castell,
- 1 Hülse mit Minen, 1 Schreib-Ziehstift,
- 1 Programmier-Schablone, 1 Radiergummi,
- 1 Programmblock und außerdem noch Platz für Notizblock und Notizblätter.

Größe: 38 x 27 x 5 cm
Gewicht: 1100 g

The programmer is not a cheap assistant, he is vital to your computer operation, and on his abilities and output depends a lot.

Every possible aid to efficient working should be used, particularly where such aid makes the job more pleasurable.

The new „programmer-set“ fulfills both of these qualifications. The most important ‚tools‘ are included in a black leather briefcase.

1 ADDIATOR-Hexadat, a small calculating machine for addition and subtraction in hexadecimal radix.

1 ADDIATOR-universal-lux for decimal calculations with negative balance.

1 conversion table showing hexadecimal from $n \cdot 10^0$ — $n \cdot 10^9$ decimal-hexa from $n \cdot 10^0$ — $n \cdot 10^9$

1 Faber-Castell, slide rule, Rietz or Disponent, 1 drawing pencil, 1 case of refills, 1 ballpen with stylus, 1 programmer stencil, 1 rubber, 1 programme-pad, and also room for papers.

Size: 15" x 10 1/2" x 2"
Weight: 39 ounces.

C. Präzisions-Rechenschieber „Castell-Addiator“

Die Rechenschieber „Castell-Addiator“, DRP., stellen eine Verbindung von Normal-Rechenschieber mit einem sechsstelligen „Addiator“-Additions- und Subtrahiergerät dar, wie es die beiden Abbildungen zeigen. Jedem Rechenschieber wird eine leichtfaßliche Anleitung, in der sich eine Maximator-Tabelle für besonders genaue Ergebnisse befindet, mitgegeben. Die 25 cm-Rechenschieber werden in Pappbehälter, die Taschen-Rechenschieber in Lederbehälter geliefert.

Nr.		RM
2323	Rechenschieber „Castell-Addiator“, System „Rietz“, mit Skala zum direkten Ablesen der Kubikzahlen und -wurzeln sowie Logarithmen, Reziprok-Teilung, Sinus- und Tangens-Teilung auf der Rückseite der Zunge. Teilungslänge 25 cm, Dreistrich-Glasläufer	22,50
2324	Rechenschieber „Castell-Addiator“ für den Kaufmann, Bankfachmann und Verkäufer. Ausführung „Disponent“ wie Nr. 4448 auf Seite 419, Teilungslänge 25 cm, Einstrich-Glasläufer	22,50
2325	Rechenschieber „Castell-Addiator“, Ausführung System „Darmstadt“, mit Reziprok-Teilung und allen Skalen des bewährten System „Rietz“, wie Nr. 4477 auf Seite 417, Teilungslänge 25 cm, Dreistrich-Glasläufer	27,—
2326	Taschen-Rechenschieber „Castell-Addiator“, mit N.-Tlg. und roter Überteilung, wie Nr. 1870 auf Seite 433. Teilungslänge 12,5 cm, Einstrich-Glasläufer	11,50
2327	Taschen-Rechenschieber „Castell-Addiator“, mit Sinus-, Tangens- und Logarithmenteilung auf der Rückseite der Zunge, wie Nr. 1871 auf Seite 433, Teilungslänge 12,5 cm, Einstrich-Glasläufer	12,—
2328	Taschen-Rechenschieber „Castell-Addiator“, Ausführung wie Nr. 2323. Teilungslänge 12,5 cm, Dreistrich-Glasläufer	13,50
2329	Taschen-Rechenschieber „Castell-Addiator“, Ausführung „Disponent“, wie Nr. 4458 auf Seite 435, Teilungslänge 12,5 cm, Einstrich-Glasläufer	13,50
2322	Taschen-Rechenschieber „Castell-Addiator“, mit Sonder-Teilung für Elektro-Ingenieure. Teilungslänge 12,5 cm, Einstrich-Glasläufer	14,40

Small analysis of the serial numbers

The ADDIATOR serial numbers consist of a 6 digits number, with or without leading letters. The letters used are M, D, B, F, P, G, A.

The serial numbers were not always used in ascending order at ADDIATOR. Probably only the large models should be taken into account. The Addimax models should not be taken into account.

Production started in 1920 with the ADDIATOR Basic model. The first numbers known to me start at 023,000, with D being used for the aluminium version and B for the etched brass version, considering the numbers below 30000. A large order for Australia and New Zealand could be responsible for the serial numbers up to 023,000 that have not yet been found. Otto Meuter's break with Carl Kübler at the end of 1921 was probably accompanied by a change from the Kübler-Meuter system to the pure ADDIATOR mark. This can be recognised by the serial numbers between 027... and 028.... The frequent design changes at the beginning are not reflected in large coherent number ranges. I therefore assume that the production quantities (apart from the large order mentioned) were small at the beginning. From numbers 030... a new pattern, the broken glass pattern, was used. At the same time, an M was placed in front of the serial number for the basic models.

The System Kübler Meuter variant starting with M15 is unusual. Here, too, only one assumption: these were produced on the occasion of the 5th anniversary. At the end of 1925, ADDIATOR stated that it had produced approx. 175,000 units. 125000 of these were exported abroad.

ADDIATOR advertised the Calulex in 1923 with a 2nd article. In the meantime, Otto Meuter's single-sided models were still being produced in small numbers, but with the A rithma (capital A) a single-sided successor was found, but the name ADDIATOR was not placed underneath. The A in front of the serial number could stand for abroad, because of 41 serial numbers beginning with A that I know of, 7 have the feature Unis France, 9 are A rithma and Duplex Sterling variants, 13 are A rithma decimal. Therefore, the A rithma would have been produced especially for foreign countries. The R474 variant is still very similar in style to the ADDIATOR Basic model in the black design. The successors to the first A rithma variant start in the number range A10 and A20 (Sterling).

Whether the ADDIATOR S12 models were produced before the first Arithma variant cannot be deduced from the serial numbers, as a separate number range was used here: P5, there is also an S12 without P. I suspect the slide adder R474 was developed before this, as the name Arithma was already protected in 1922.

The Quantotor models also have their own number range G7.

The serial numbers of the Putty model all start with 40 and the trade mark was registered in 1924. The successor to the Addiatrix was also documented with 41.

Duplex, Triplex, Astro and Elsarie are frequently represented in the D3 number range. No serial numbers are known for the Perplex.

It is striking that no serial numbers are known for the small models and that the medium sizes, without Putty and Addiatrix, were only exceptionally given a number.

Accordingly, D0 / B0 / M0 / A0 would be in ascending production order in the last 5 digits. Labelled here as Group1.

A10 was blocked for Arithma, therefore M12 to M14 follow the previously mentioned group1.

M15 was blocked for balance machine with glass breakage.

A20 was blocked for Arithma Sterling

40 was blocked for Putty

41 was used for Addiatrix

P50 or 50 was blocked for Basic model S12

P55 was blocked for Basic model S12 3 decimals

G70 was blocked for Quantotar.

M3 / M9 / F8 / F9 cannot be clearly classified, probably all have in common that no arrow symbol was used.

Between 1926 and 1929 ADDIATOR decides to do without the leading letters, except for the blocked areas. Exceptions remain the letters A and D.

3. ADDIMULT

Shortly after the Second World War, December 1945, the first ADDIMULT slide adders were produced in Switzerland by Addimult A G Spezialfabrik für Recheninstrumente. In 1947 the company was closed and Hans Wolfgang Kübler(1909-1987) traveled to Sweden, where he sold further parts under the ADDIMULT brand engraved with Made in Sweden. In 1949 Kübler founded the ADDIMULT Rechenmaschinenfabrik in Bad Harzburg. In 1958 the company moved to Donaueschingen. Production stopped in the early 1970s.

H.-W. Kübler had taken two sets of tools from his father's company during the turmoil of the Second World War. However, only the large models, such as Summator, Supra, etc. match the ADDIATOR large models.

For many years there was a competition within the family.

R372 Supra Rupee Made in Sweden

Size comparison Attention Addiator Duplex shown is from Addimult see R537

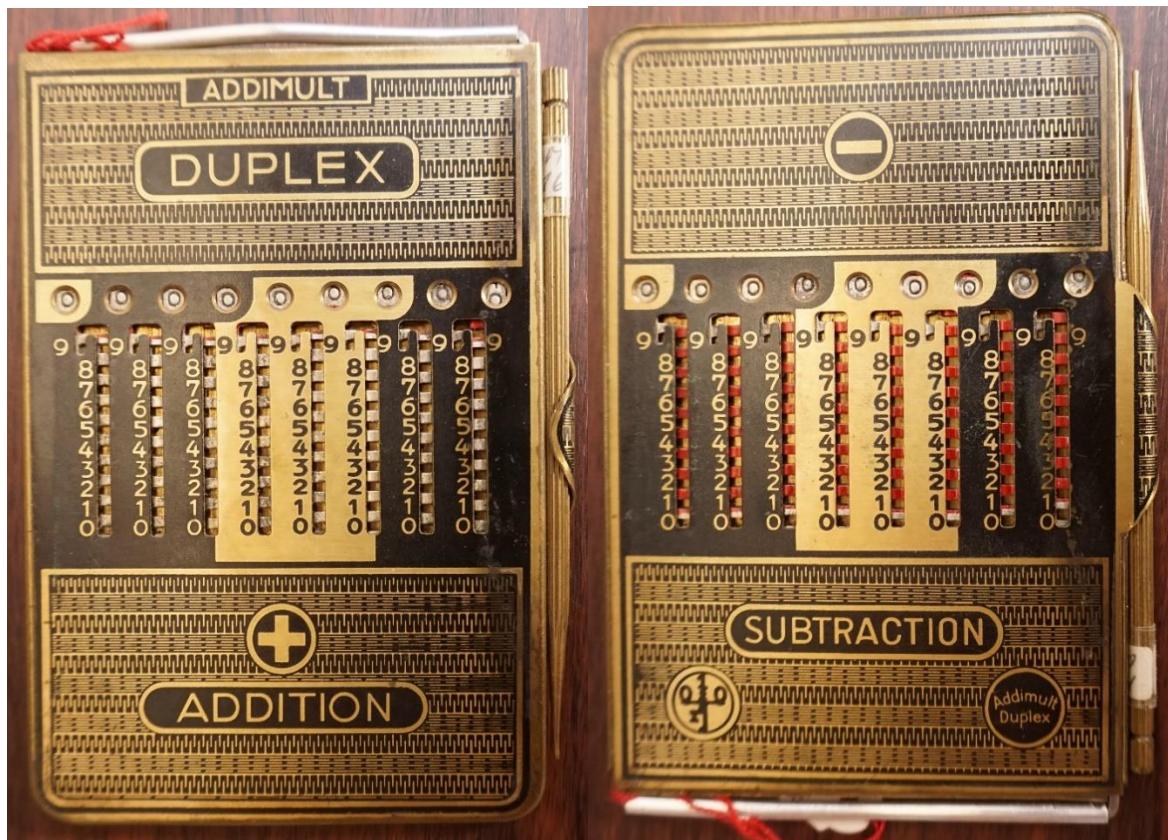

The large models of Addimult and Addiator are identical in width and length.

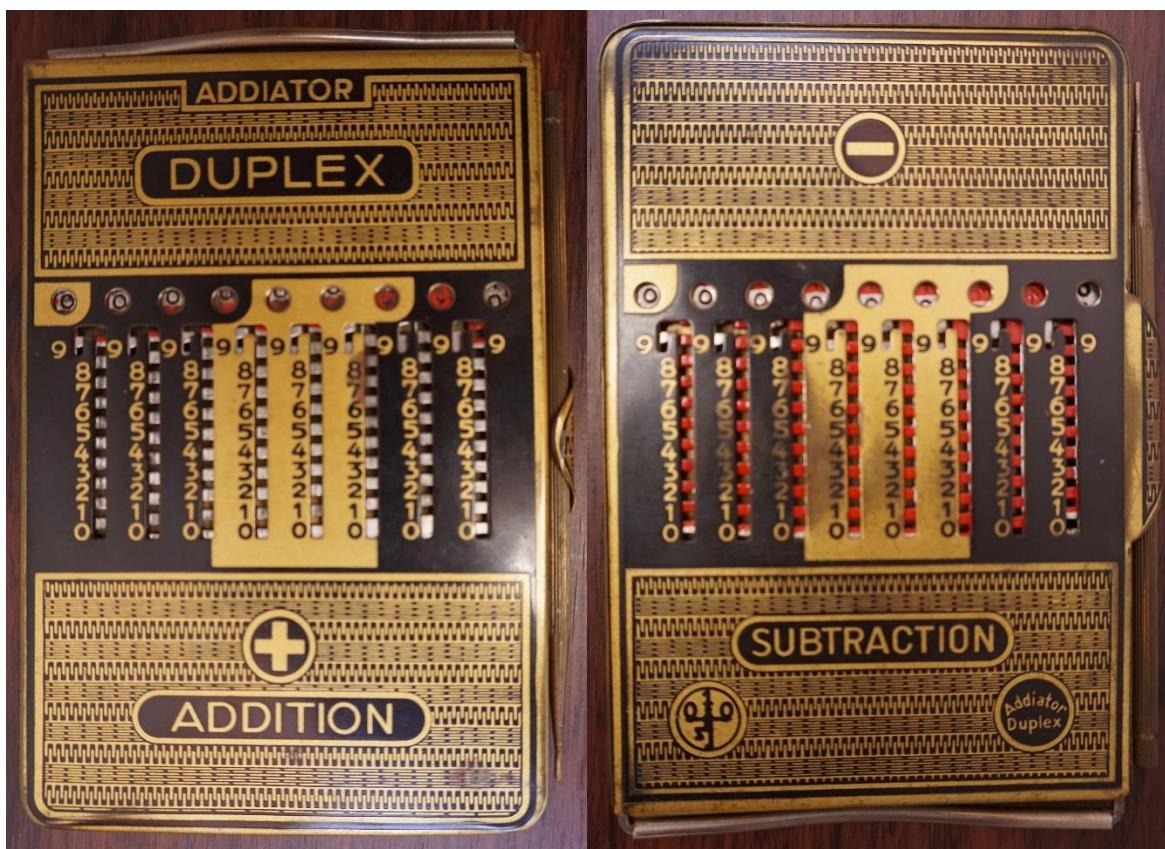

In contrast to Addiator, Addimult has chosen a different bracket shape.

R790 ADDIMULT DUPLEX Made in Customs Territory of SWITZERLAND

R537 ADDIMULT DUPLEX (ADDIATOR)

R853 ADDIMULT DUPLEX (ADDIATOR) Italian variant

ADDIMULT had apparently also produced slide adders under the ADDIATOR brand, because ADDIATOR would not have purchased its own duplex size tool set that would have deviated from the standard size of the medium-sized slide adders. The size clearly speaks in favour of ADDIMULT and is further emphasised by the ADDIMULT logo

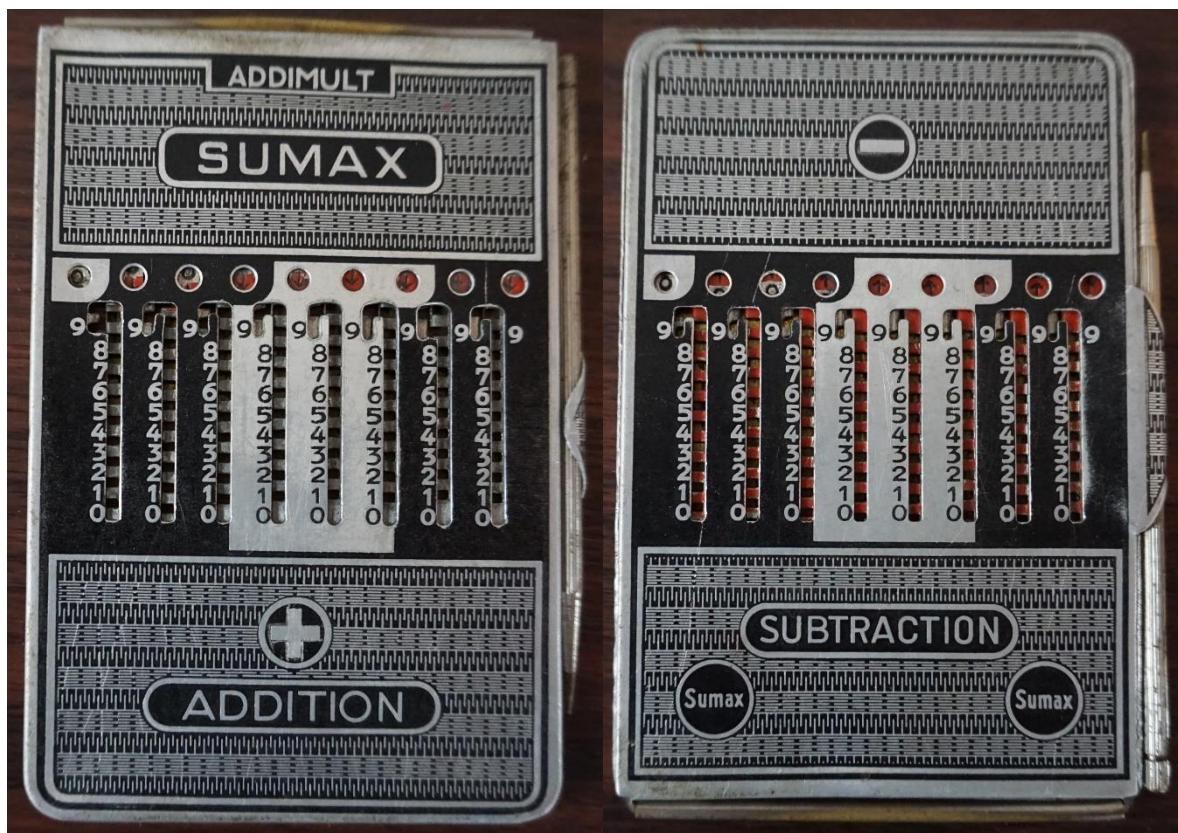

Size comparison ADDIMULT Duplex (still with ADDIATOR brand) with ADDIATOR Duplex. ADDIMULT Duplex is 5 mm wider.

R849 Summator and Spreadsheet 99x999 (bis 100 x 1000) SN 793526

R849 Instructions for use

Division: Man drückt auf die 25 und sucht in Kolonne 256 die nächst kleinere Zahl als 7327 : 256 = 28,62
~~7327 : 256~~ → 7327, das ist 7168 neben der 28. Die 28 wird als erste Ergebnisziffer notiert. 7327 wird in der **äußersten linken** Kolonne beginnend in die Maschine eingezogen. Rest 28.
Auf der Rückseite der Maschine wird hiervon 7168 abgezogen. Rest 159. Komma in Resultat hinter 28 setzen und 2 Nullen an Rest anhängen. Man sucht dann in der gleichen Kolonne 256 die nächst kleinere Zahl als 15900 und findet 15872 neben der 62. Die 62 wird im Ergebnis notiert und 15872 auf der Rückseite der Maschine von dem dort bereits stehenden Betrag abgezogen. Rest 28.
Falls man noch weitere Stellen im Resultat hinter dem Komma benötigt, kann man dieses Verfahren beliebig fortsetzen, also wieder an den Rest 2 Nullen anhängen, nächst kleinere Zahl aufsuchen usw.

Kalkulationstabelle
für Zuschläge auf den Einkaufspreis bei verschiedenen Verdienstprozenten - Sätzen vom Verkaufspreis

Beispiel: Einkaufspreis = 24,80. Sie wollen 35% vom Verkaufspreis verdienen. Wieviel müssen Sie auf den Einkaufspreis zuschlagen?
Bitte nebenstehende Tabelle ansehen! Neben der 35 in der Spalte V lesen Sie 54 in Spalte E, d. h. 54% Zuschlag auf den Einkaufspreis sind nötig.
Auf Seite 24 ablesen:
Zuschlag = $24,8 \times 0,54 = 13,39$
+ Einkaufspreis = 24,80
= Verkaufspreis = 38,19

Beispiel: $319 \times 212 = 67628$
Man drückt auf die 31 und schlägt die darüberliegenden Seiten auf. Man liest in Spalte 319 in Zeile 12 =
Etwas darüber steht in Zeile 2 2 x 319 = 638..
Die Addition beider Zahlen, wobei die 2. Zahl immer 2 Stellen nach links gerückt wird, ergibt das Resultat = 67628

Beispiel: 35% von DM 66,27 = 23,19
Man drückt auf die 3 des Registers und schlägt die darüberliegende Seite auf. In Spalte 35 liest man in Zeile 27 = 945 und in Zeile 66 = 2310..
Resultat = 231945
= abgerundet DM 23,19

Beispiel: $643 \times 2531 = 1627433$
Man fügt mit dem linken Daumen unter die 63 und schlägt Seite 64 auf. In den senkrechten Spalte 643 steht 31 x 643 = 19933
In der gleichen senkrechten Spalte 643 steht 25 x 643 = 16075..
Die beiden Zahlen werden um 2 Stellen nach links versetzt zusammengezählt. Resultat = 1627433

Am einfachsten macht man dies mit einer Addimult Addiermaschine indem man die Zahl 19933 von rückwärts beginnend einzieht und dann 2 Stellen weiter links beginnend die Zahl 16075 ebenfalls von rückwärts einzieht.

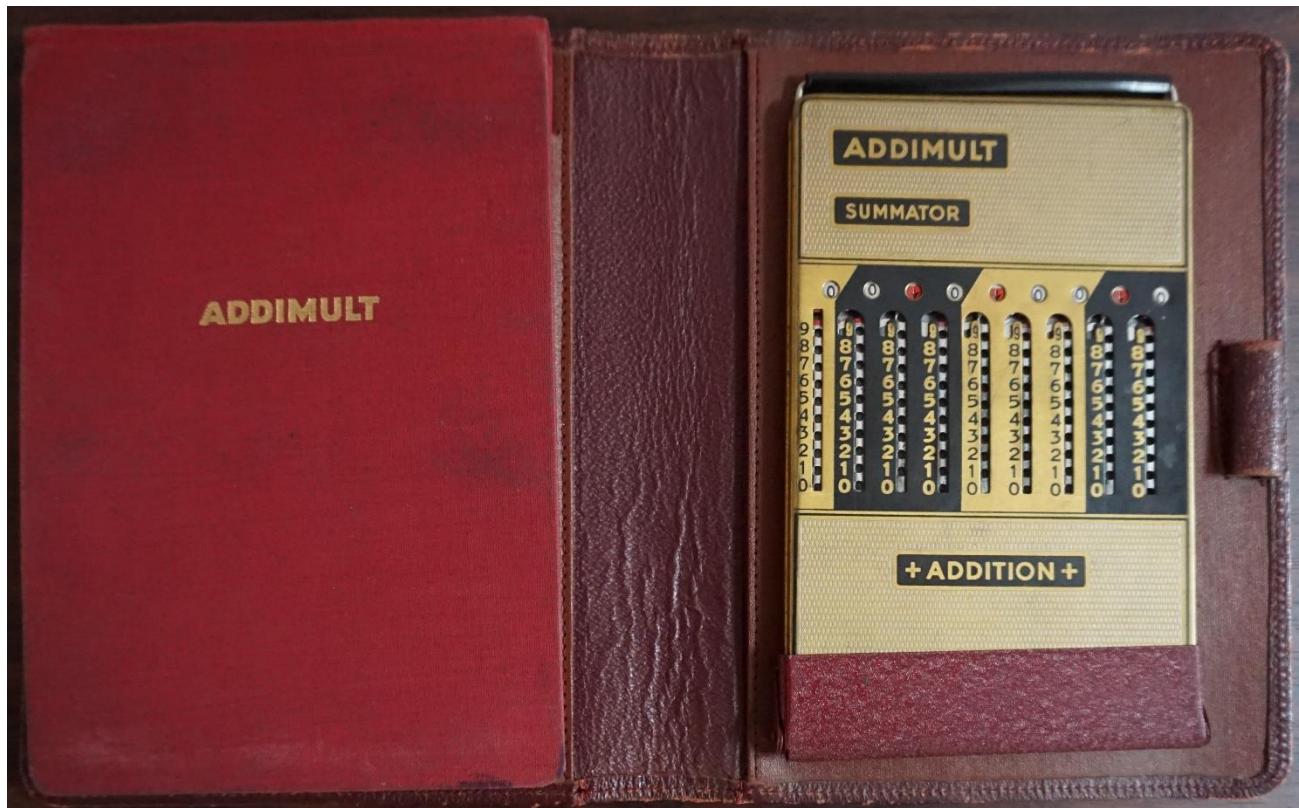

Beispiel: $53,19 \times 26,38 = 1403,1522$
Man drückt auf die 1 und liest in Spalte 19 sowie 19 x 38 = 722
und liest in Spalte 53 sowie 19 x 26.. = 494..
53.. x 38 = 2014..
sowie 53.. x 26.. = 1378...
Resultat = 14031522

Man setzt Punkte für die rechts vor den Zahlen beim Bilden der Teilergebnisse fortgelassenen Ziffern.
Beim Einziehen der Teilergebnisse in die Maschine (immer rückwärts beginnend) lässt man ebensoviel Kolonnen rechts frei wie die Summe der Punkte rechts von den multiplizierten Zahlen ausmacht.

4. ProCalculo! and CORRENTATOR

Otto Meuter was able to work on further developments in the ADDIATOR workshop after the start of production at ADDIATOR. His goal was a single-sided specimen. He made the tools for this in ignorance of Carl Kübler. With his ally Jean Bergmann the competition to the ADDIATOR began. The ProCalculo! was probably the first calculator to be marketed by CBR. The tools were later returned to ADDIATOR. ADDIATOR also took over production.

There was also a large version of ProCalculo! CALCULEX, OBRA and IMAC are identical in appearance and design. OBRA is an abbreviation for Otto Brabant . Two result lines, as intended in his original design, are presented here.

The CORRENTATOR, a single-sided slide adder with a reversible plate that was further developed by Jean Bergmann, was later produced in Switzerland as the CORRENTATOR UNICAL. As the successful Berlin businessman was persecuted by the Nazis because of his Jewish faith, he fled to Switzerland at the end of the 1930s.

Alle Zahlenschieber auf Null stellen!

Regel: Uebertrage die Zahlen mit dem Ziehstift in die Maschine, indem du in die Zahnlücke links der Zahl eingreifst. Weiße Zahnrungen ziehe nach unten, farbige nach oben. Geh, wenn die Kahn in einem Bogen schließt, herum bis zum Anschlag.
Addition: Ziehe 6 (weiß, nach unten), dann 8 (farbig, nach oben im Bogen herum). Resultat 14.

Subtraktion: Lege die Mittelklappe nach oben, ziehe 7 ab, indem du diese Zahl (weiß weiß) nach unten im Bogen herumführst. Es erscheint 7. Greife dann z. B. 3 und ziehe (weiß farbig) nach oben. Resultat 1.

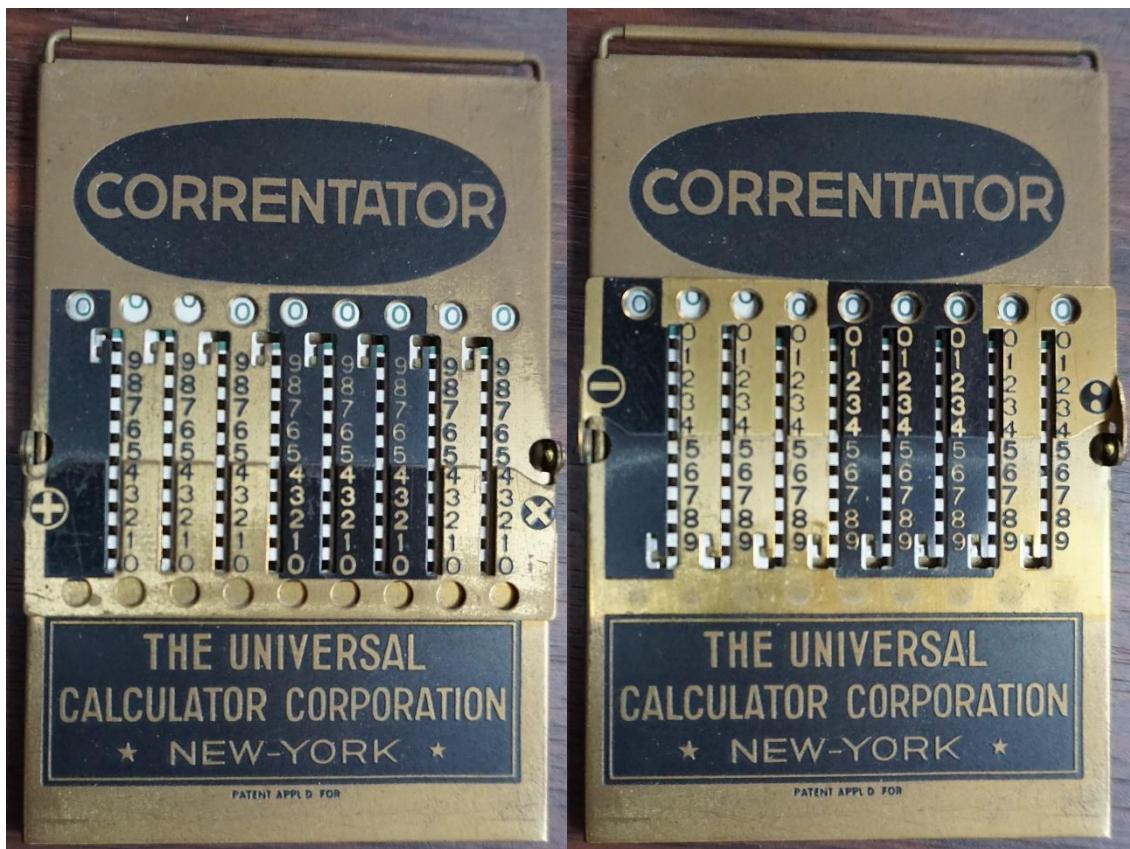

Signale: Erscheint bei der Addition im Resultatfenster ein Loch, führe die Null der Lochkolonne nach oben herum. Z. B. 99 - 6. Resultat 105. Erscheint bei der Subtraktion im Fenster eine weiße Scheibe, ziehe die Null dieser Kolonne nach unten herum. Z. B. frage 100 ein, lege die Klappe um, ziehe 6 ab und führe in der Kölonne mit der weißen Scheibe die Null nach unten herum. Ergibt 94.

Lösung: Hoch- u. Niederziehen des Bügels.
Auskunft: durch Ihre Lieferfirma. — Zehntausende im Gebrauch. — Glänzende Zeugnisse. — Kurze Uebung bringt sichere Beherrschung.

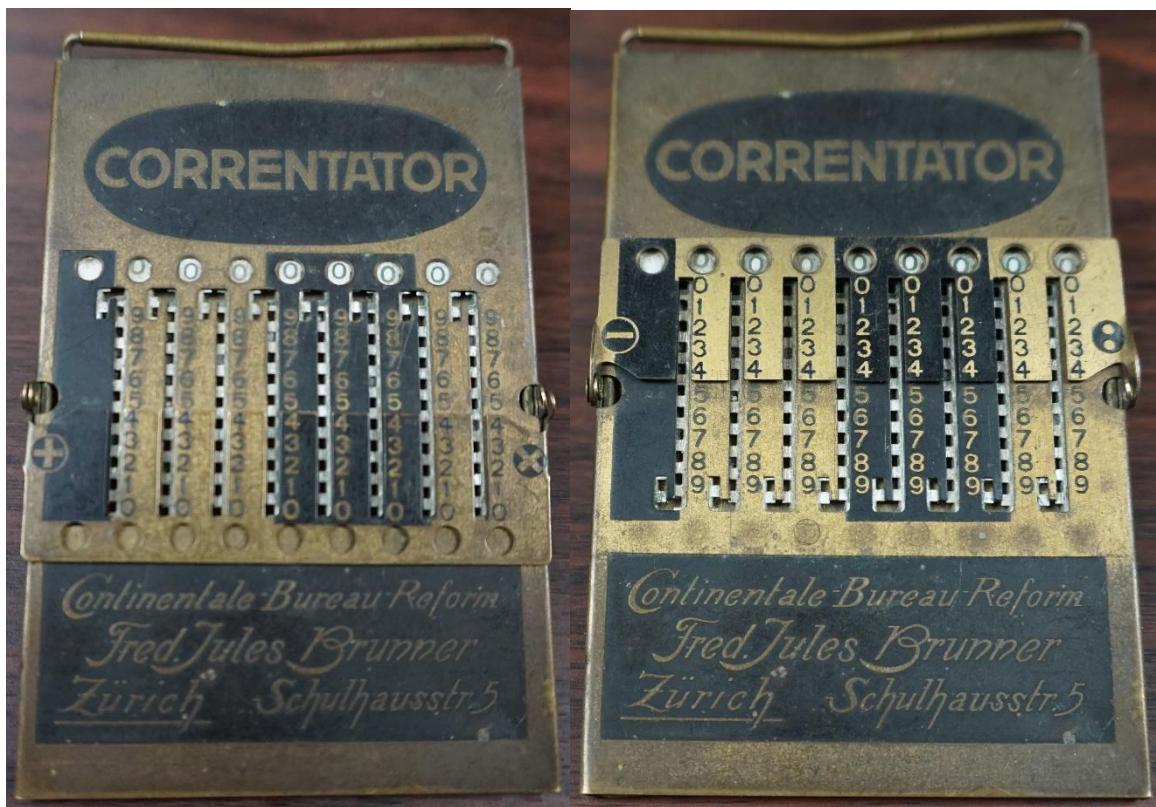

Patentiert in allen Kulturstaaten.

Gebrauchs-Anweisung.

On the small models with serial numbers starting from 93151(SN where I recognized it), only + and - are shown on the right and left of the reversing plate, before that you will find +x and -:. On the large models, Exactus and Midget, + and - can only be found on the right.

5. PRODUX and Record

Otto Meuter(1892-1975) had the name PRODUX protected in 1927 and sold single-sided slide adders and later calculating machines under this brand from 1928 onwards. In the post-war period, Claus Meuter succeeds in transferring presses and tools from Berlin-Neukölln to Achim near Bremen. In 1950, the new company Otto Meuter and Sohn oHG is registered at the local court. Typically, the PRODUX slide adder has a result field in the centre and addition takes place below the result line, subtraction above. The small addiator models are very similar to this design. With Produx, however, the 9 is placed in the centre and Addiator uses the 0 as the starting point.

The RECORD model, identical in construction to PRODUX RECORD, was developed in the GDR by Lucie Meuter , the divorced wife of Otto Meuter. At the end of the 1940s, Claus Meuter had handed over cutting and punching tools from the Klausdorf plant in Berlin to his mother, as the Soviet Union had imposed a blockade to prevent transport to West Germany. Slide adders were produced here until 1983. In the logo, the L is linked to the M. Only one model was produced: RECORD

Otto Meuter has put a final exclamation mark on the slide adder OM.

**CALCULADORA DE BOLSILLO MARCA
EXACTA =
SUMA - RESTA - MULTIPLICA - DIVIDE**

INSTRUCCIONES PARA SU USO

Operé siempre con el estilete inclinado a la derecha al marcar los números y accionar las cremalleras.

Operación de SUMA

Para sumar, se utiliza la mitad inferior de la máquina que está señalada con el signo de (+).

Antes de sumar, debe tenerse cuidado de que la máquina esté bien a 0 el cual debe aparecer en todas las ventanillas del totalizador.

Al dar comienzo a la suma, se introduce la punta del estilete en el agujero siempre a la IZQUIERDA de la columna correspondiente y en el número que se desea sumar, accionando hacia abajo hasta el final, tope A.

Cuando al introducir el estilete en el agujero este sea BLANCO, debe accionarse la cremallera SIEMPRE HACIA ABAJO HASTA EL FINAL, tope A. Cuando el estilete entre en la cremallera entre puntos ROJOS, debe accionarse la cremallera SIEMPRE HACIA ARRIBA DANDO LA VUELTA hasta el tope B.

Cuando al hacer la suma aparezca la ventanilla si-

Slide adder overview Germany more

Justin Wilhelm Bamberger had founded the company Export and Import Business for American Bureau Equipment in 1902. He was certainly familiar with The Locke Adder and shortly afterwards designed the Universal.

Universal

Omega

The manufacturer was the company Mercedes, Mehlis. The patent was granted in 1912. In the catalogue Gebr. Wichmann from 1913, the slide adder was offered for 12 M. under catalogue number 1944. Zocher, Kontorbedarf 1915 lists a sales price of 18 Mk. The illustration of the slide adder is different, with and without D.R.P. The trick was also offered with the currency pound sterling.

AD-ABASUB

Produced by ABA Apparatebau Ges. m.b.H. ca 1923. There was a legal dispute with ADDIATOR.

Plu-Mi

Produced with our authorisation and help. Information on an envelope from ADDIATOR.

For calculating calories, from the company IWA produced with a pen from ADDIATOR

The invention is probably the last new design of a slide adder.

Kaloriemeter

Calculator with plastic back similar to Magic Brain, but with a different size. Made in Germany. If you compare Wizard R585 with R196 W Calculator or Wizard R275 with R383 X-Acta, you can assume that they all come from the same manufacturer. The manufacturer is Wizard Werke from Bonn. These slide adders were cheap products and so it is reasonable to assume that production was later relocated to Japan and Hong Kong, as the similarity is very striking.

Gebrauchs-Anweisung
für die
Rechenmaschine „+ – ×“

Addition: Man greife mit dem Rechenstift in die dem Summanden entsprechende Zahleinrücke und schiebe wenn Schieberteil weiß, nach unten, wenn Schieberteil farbig, nach oben u. umkreise den oberen Übertragungsbogen am äußeren Rande herum bis zum Anschlag. (Zehnerübertrag.)

Es kommt bisweilen vor, daß ein Uebertragsbogen gesperrt ist (Zeichen für Hunderter-Uebertrag), was sich dadurch kennzeichnet, daß die Uebertragung durch Hemmung nicht möglich wird. Dies kommt jedoch nur vor, wenn der nächst höhere Zahlschieber im Schauloch „9“ zeigt. In diesem Falle ist es notwendig in der nächst höheren Stelle eins mehr einzutragen als addiert werden soll. Z. B.: Es soll die Zahl 385 addiert werden und beim Hochschieben der „5“ ist, wie oben angegeben, eine Sperrung, so muß in der Zehnerstelle anstatt in „8“ in „9“ eingegriffen werden. Folgt nach der Hemmung keine höhere Zahl mehr, so muß in der nächst höheren Stelle anstatt „0“ „1“ addiert werden.

Lösung: Ermöglicht man durch Einstecken in „0“ und gänzlichem Hochschieben sämtlicher Schieber bis Wiederstand erfolgt.

Subtraktion: Ist die zu subtrahierende Zahl kleiner als ebensogroß der im Resultatfenster der betreffenden Stelle stehenden, so wird bei 0, also am unteren Anschlage, eingriffen und bis vor die Zahl auf der Deckplatte geschoben, die abgezogen werden soll. Ist sie größer, so wird am oberen Anschlage, d. h. in die linke untere Ecke des oberen Uebertragsbogens eingegriffen und dieser außenherum, also erst aufwärts, dann rechts herüber und wieder abwärts umkreist bis vor die Zahl auf der Deckplatte, die abgezogen werden soll.

Ist bei Subtraktion ein Uebertragsbogen gesperrt, so wird zunächst nur der rechte Schieber vom oberen Anschlag herab bis vor die gewünschte Zahl auf der Deckplatte geschoben

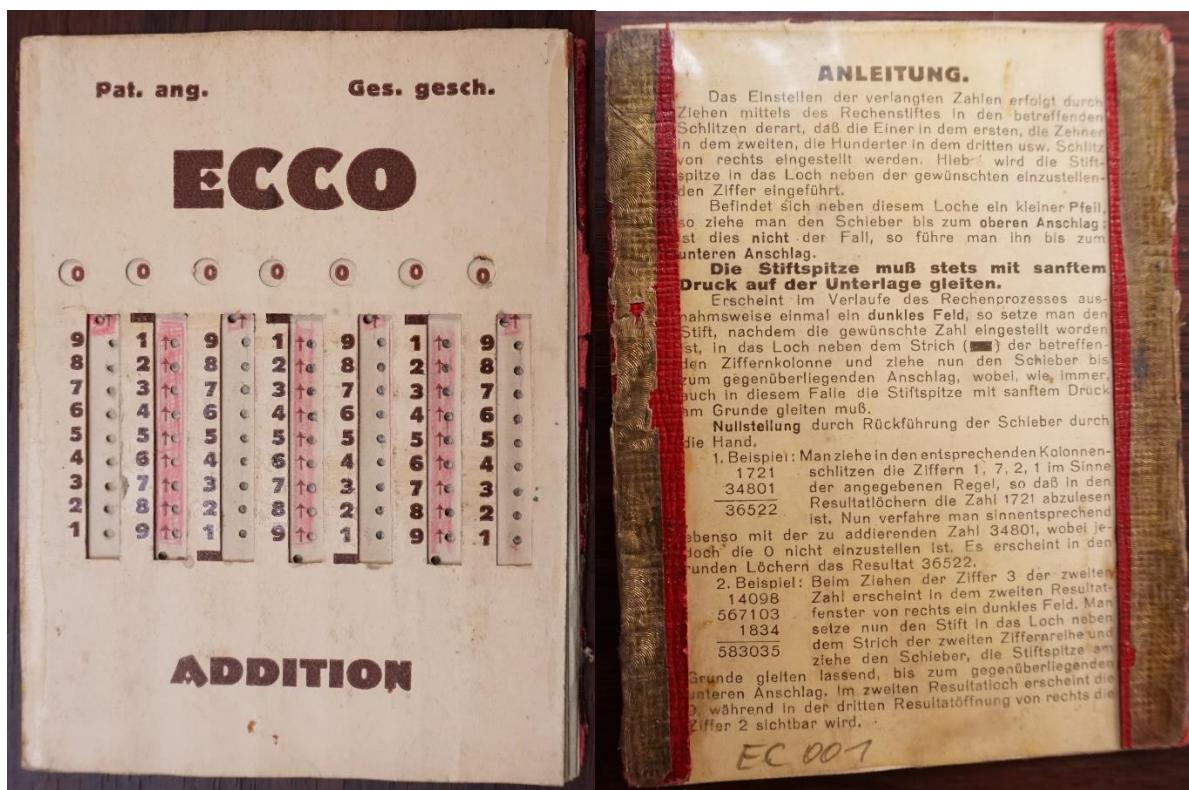

und der Schieber der nächsthöheren Stelle um 1 höher, als in dieser Stelle abgezogen werden soll, Z. B. anstatt auf 0 auf 1, oder 1 auf 2, 2 auf 3 usw.

Addition und Subtraktion können beliebig nach- und durcheinander ausgeführt werden! Konto-Korrent- und Staffelrechnungen.

R318 ORIGINAL „UNIC“

R772 ecco

R382 ADISUMA

„ADISUMA“
SALDA Hand - Rechenmaschine

Gebrauchs-Anweisung.

Die „Adisuma“-Rechen-Maschine besitzt eine Wendeplatte, welche auf der Plusseite (+) die Einstell-Zahlen 1-9 (von unten nach oben gelesen) für die Addition und Multiplikation trägt.

Wird diese Wende-Platte hochgehoben und umgewendet (- = Minus-Seite), so sind die Subtraktionszahlen 9-1 (von unten nach oben gelesen) sichtbar. Diese werden für die Subtraktion und Division benutzt.

Münz-Rechnungen: Zum rascheren Auffinden der Stellenwerte sind die Zifferreihen auf beiden Seiten der Wendeplatte durch mehrfarbige Felder unterteilt.

Soll nicht in Dezimalen gerechnet werden, so benützt man die letzte Spalte rechts als Einer-Stelle, die zweite für Zehner, die dritte für Hunderter, die vierte für Tausender usw., die siebente für die Einstellung der Millionen-Werte; die Maschine rechnet bis 10.000.000.

Grund-Regeln:

Null-Stellung: Vor jeder neuen Rechnung die Maschine auf 0 stellen. Den oberhalb der Maschine befindlichen Bügel nach oben ziehen, bis in allen Schau-Löchern der Resultats-Kolonne nur „Nullen“ sichtbar sind und den Bügel wieder ganz zurück nach unten drücken.

Rechenstift immer senkrecht neben der zu rechnenden Zahl einsetzen, und wenn der Stift zwischen blanken Zahlen einsetzt, nach unten ziehen, wenn der Stift zwischen roten Zahlen einsetzt, nach oben ziehen. Der Stift ist immer bis an das Ende des betreffenden Schlitzes zu führen, also dort, wo sich U-förmige Haken befinden, auch bis an das Ende dieses Hakens.

U-Enden der Schlitzte: Diese dienen zur Zehner-Übertragung. Durch das Umfahren dieser U-Enden nimmt der Stift den nächsten, links liegenden Schieber um ein Teil mit und erfolgt hierdurch die Zehner-Schaltung ganz selbsttätig.

rote Sperr-Signale:

Ist das Umfahren des U-Endes in irgend einer Spalte durch einen längeren roten Signalzahn versperrt, so wird der Stift in der linken danebenliegenden Spalte bei „1“ neu eingesetzt und wieder bis an das Ende des U-Hakens gezogen.

Beispiel: für Addition: $98+7=105$
Subtraktion: $104-5=99$
Diese mehrfache Zehnerübertragung kommt äußerst selten vor.

Obige Grund-Regeln gelten für alle Rechnungs-Arten.

Instructions for use

Gebrauchsleitung

Mit Ihrem Kalorienzähler sind Sie in der Lage, Ihren täglichen Verbrauch an Nahrungsmitteln in Form von Kalorieneinheiten auf Ihren persönlichen Bedarf festzulegen. Eine Kontrolle über die zu sich genommenen Kalorien war bis jetzt nur möglich, wenn eine Kalorientabelle, Papier und Schreibstift zur Hand waren, was sich auf Reisen und im Beruf als sehr umständlich oder als nicht durchführbar erwies. Dieser Kalorienzähler soll Ihnen nun die Möglichkeit geben, in müheloser Art den Kalorienwert der aufgenommenen Nahrungsmittel, welchen Sie aus der Tabelle ablesen und auf den Zähler übertragen, nach Ablauf eines Tages zu kontrollieren. Mittels eines Beispiels möchte ich Ihnen die Handhabung des Kalorienzählers erläutern: Angenommen Sie würden zu sich nehmen:

100 g Lachsschinken, 50 g Knäckebrot, 100 g rote Beete. Nach der Kalorientabelle finden Sie unter Lachschen die Zahl 140. Nun nehmen Sie Ihren Stift, welcher neben dem Kalorienzähler in der Mappe eingeschlossen ist und beginnen unter der Zehnerstelle, in dem Sie bei dem eingestanzten Loch neben der 4 den Läufer nach unten bis zum Anschlag durchschieben; in der gleichen Weise dann die 1. Die aufgedruckten Zahlen unter dem Läufer entsprechen genau dem einzustellenden Zahlenwert, nämlich Einer-, Zehner-, Hunderter- und Tausender-Werte. In unserem Beispiel kommen nun 50 g Knäckebrot mit 191 Kalorien zur Einstellung, Sie beginnen mit der Einerstelle, d. h. Sie ziehen die 1 bis zum Anschlag nach unten, dann die 9 auf der Zehnerskala und nun werden Sie feststellen,

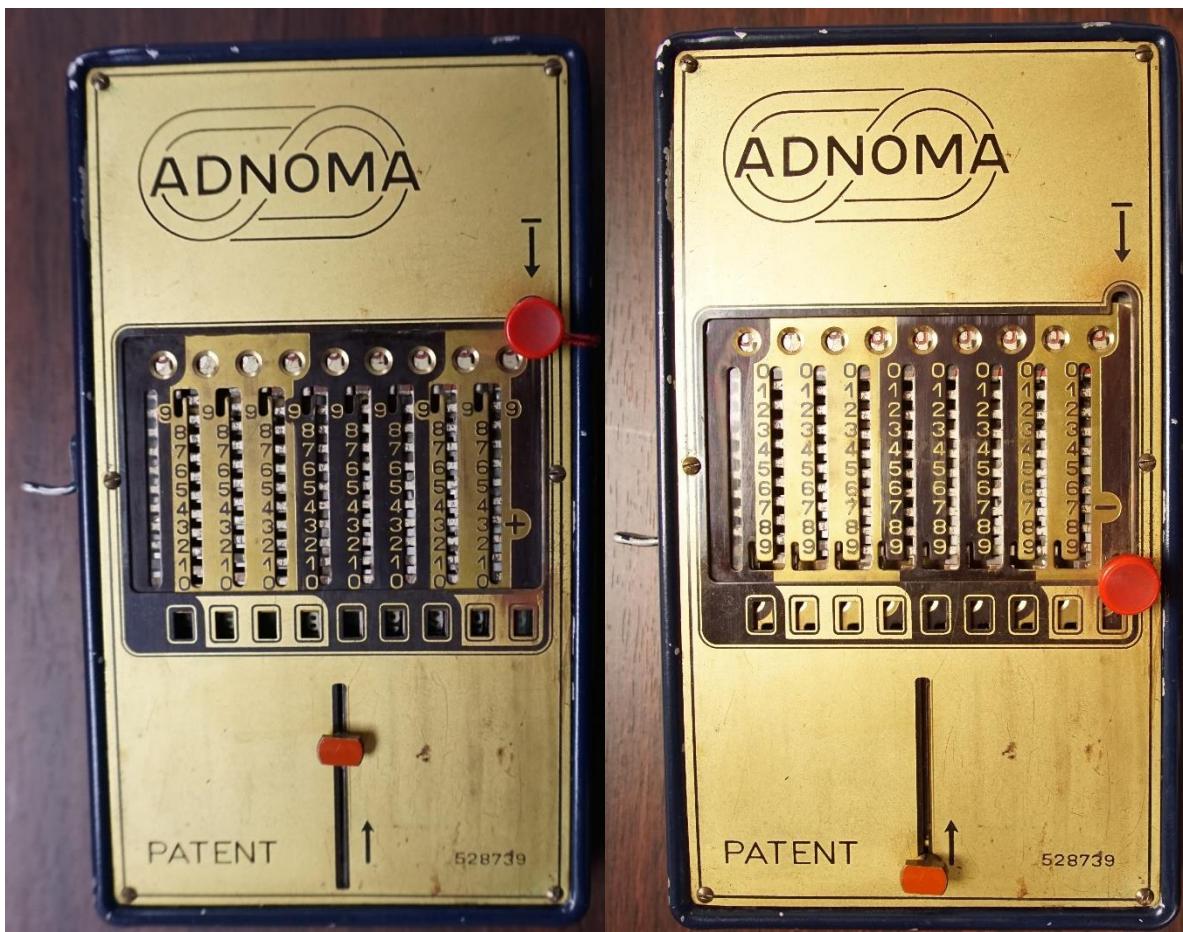

dab nur noch 6 Werte eingestellt werden können. Wenn Sie diese 6 Werte nach unten gezogen haben, sehen Sie auf Ihrer Summenskala, welche über dem einzustellenden Wert ist, einen Pfeil nach links. Das bedeutet, daß Sie auf der Hunderterskala einen Wert einstechen müssen und nach unten ziehen. Nach dieser Tätigkeit bringen Sie die Zehnerskala nach oben in die Ausgangsstellung, daß auf Ihrer Summenskala „0“ erscheint und nun müssen Sie die fehlenden 3 Stellen auf der Zehnerskala erneut nach unten bis zum Anschlag durchziehen. Somit haben Sie die zweite Stelle, bestehend aus 6 + 3 addiert und können nun den Hunderterwert um einen weiteren Punkt nach unten ziehen. Als letztes wären nun rote Beete mit 29 Kalorien einzustellen. Sie beginnen wieder mit der Einerstelle. Hierbei verfahren Sie genau wie vorher bei der Zehnerskala angegeben.

Wenn Sie nun den Wert in der Summenskala kontrollieren, dann muß bei Ihnen die Zahl 360 sichtbar sein. Anhand dieses ermittelten Wertes können Sie nun persönlich feststellen, bei welchen eingenommenen Kalorienzahl Sie zunehmen, Ihr Gewicht halten oder abnehmen. Damit sind Sie in der glücklichen Lage, individuell Ihren Kalorienbedarf festzulegen.

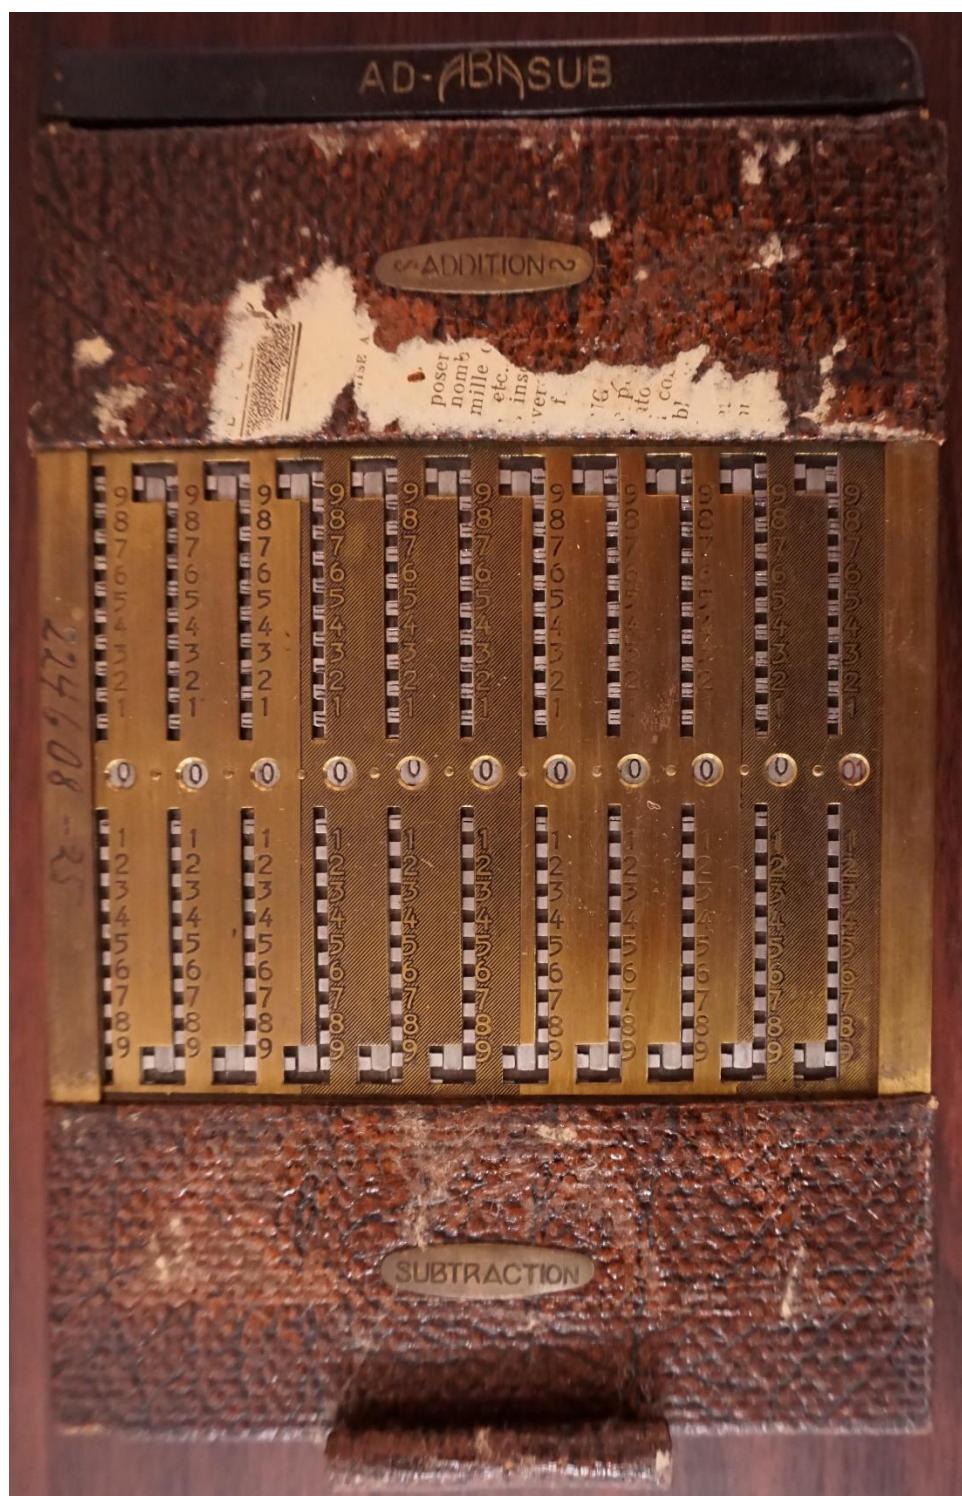

Ich hoffe, daß Sie mit Hilfe Ihres Kalorimeters Ihre Traumfigur erreichen, behalten oder wiedererlangen und wünsche Ihnen dazu viel Erfolg.

Ihre
Erna Huttenlochner

7. France

Slide adder overview France

The Frenchman Louis-J. Troncet lived from 1850 to 1920 and was a teacher and inventor. His patents related to a numerator, which was probably never produced, and various versions of the Arithmographe Troncet. The Arithmographe Troncet was produced from 1889. There are result fields for subtraction and addition. Above and below is a sticker bar where you can make a note of intermediate results. When the sticker is removed, you can see a continuous colour between SOUSTRACTION and ADDITION (sometimes shown as a separate variant). The manufacturer is Ve P. Larousse & Cie (advertised in Russia in 1892) and Librairie Larousse (advertised in Nature in 1890). In 1890, the slide adder could be purchased for 4 francs, see La Federation Horlogere 6 September. In 1907, another large model was patented. A description in the magazine La Nature already included an illustration in 1902. I found the last advertisement in La Nature from 1911. Here H. Morin, 11, Rue Dulong, Paris offers under catalogue number 1236 the Arithmographe Troncet with 7 digits for 8 Francs and under catalogue number 9114 a model with 13 digits, modèle du bureau for 25 Francs, as well as a grand modèle with 20 digits for 45 Francs.

Operating instructions for R254

INSTRUCTION SUR L'ARITHMOGRAPHÉ

Description. — L'appareil se compose essentiellement des plusieurs pièces d'une *fonction* fixe dans laquelle sont pratiquées des fenêtres circulaires et des rainures en forme de croissons.

Le creux des dents des pièces mobiles correspond exactement aux dix chiffres de la numération, écrits plusieurs fois en colonnes verticales sur la feuille fixe.

Fonctionnement. — Les calculs se font mécaniquement au moyen d'une pointe mousse quelconque, assez résistante pour faire glisser les pièces mobiles.

Réglage. Pour opérer sur un chiffre, placer la pointe dans le creux de dent qui est à droite de ce chiffre et glisser jusqu'au bout de la croise, soit vers le bas lorsqu'on agit sur une dent blanche, soit vers le haut lorsqu'on agit sur une dent noire.

Opérations. — Au commencement de toute opération, l'arithmographe doit être à zéro. Nous disons qu'il est à zéro lorsque ce chiffre apparaît à toutes les fenêtres inférieures, sauf à celle de gauche qui présente un blanc.

Pour mettre à zéro, on remonte les pièces jusqu'à l'arrêt supérieur qui limite leur course dans l'appareil.

ADDITION. — I. Quel est le total des nombres 8, 6, 5, 9?

L'appareil étant à zéro, opérez dans la première colonne de droite de la dernière croise : Placez 8 et ensuite la pointe du crayon dans la denture des pièces mobiles à droite des chiffres donnés 8, 6, 5, 9, et glisser chaque fois jusqu'au bout de la croise, soit vers le bas lorsque la pointe tombe entre les dents blanches, soit vers le haut en suivant la courbe lorsqu'elle tombe entre les dents noires. Le total 28 apparaît aussitôt en bas aux fenêtres d'addition.

II. Additionner les nombres suivants : 24 fr., 57 fr., 876 fr.

Opérez comme s'il s'agissait d'inscrire les nombres donnés 57 et 876 dans la première colonne de droite et 24 dans la colonne des unités. Le total 957 apparaît dès que les nombres sont inscrits.

III. On a dépensé successivement 3 fr., 45, 6 fr. et 2 fr. 15. Quel est le montant de la dépense?

En affectant les deux dernières colonnes aux chiffres décimaux, 3,45 et 6,00, les unités s'inscrivent à la troisième colonne et on lit 12,50 au total.

SOUSTRACTION. — L'appareil étant à zéro aux fenêtres d'addition, on voit le chiffre 9 aux fenêtres de soustraction. Inscrire d'abord le grand nombre aux fenêtres de soustraction et le petit nombre à droite du plus haut chiffre à inscrire. Ensuite le petit nombre s'inscrit suivant la règle générale et le reste peut être retranché.

I. Retrancher 3 de 7.

Opérez sur la gauche. Inscrivez le grand nombre en placant la pointe 7 du crayon à droite de la division 3 et en descendant jusqu'en regard du chiffre 7. Le petit nombre 3 s'inscrit suivant la règle et le reste 4 apparaît ainsi.

II. Que reste-t-il de 85 fr. si l'on a pris successivement 65 fr., et 14 fr. ?

Dans la pratique, on ferait ici deux opérations ; l'arithmographe présente l'avantage de ne faire qu'une opération : inscrire le grand nombre comme 85, puis le petit nombre 65 et suivre de deux zéros (00), puis inscrire par le procédé ordinaire les nombres à retrancher, et le reste 45,55 se lit aux fenêtres de soustraction.

Cercle gris. — Lorsqu'un cercle gris se montre dans une fenêtre à la place d'un chiffre, il n'y a pas lieu de s'en préoccuper ; cependant s'il persistait, il pourrait devenir une gêne. On jugera très vite si nécessairement il est utile de le chasser. Il va sans dire que pour lire un résultat il faut chasser le cercle gris. Pour cela placer la pointe en bas à la division 0, et remonter jusqu'à l'autre bout de la croise.

Avertisseur. — Le présent appareil porte sept ordres d'unités : il donne des résultats précis jusqu'à 1000. Lorsqu'on dépasse cette limite, ou qu'on propose à l'appareil un calcul impossible (par exemple de retrancher 36 de 24), un cercle noir, l'*avertisseur*, apparaît à la dernière fenêtre de gauche.

Tables de l'arithmographe. — Il n'est nécessaire de faire deux opérations en arithmétique : l'addition et la soustraction. La multiplication n'est autre chose qu'une addition abrégée, et la division, une soustraction abrégée.

Les tables suivantes démontrent une série de nombres qu'il suffit d'additionner ou de soustraire sur l'arithmographe pour effectuer une multiplication ou une division.

Tous les nombres, de 0 à 999, sont écrits par ordre dans des cases distinctes ; ainsi l'on voit successivement les cases 0, 1, 2, 3, 4, etc. Toutes les cases sont semblables entre elles : en tête de chacune est le nombre principal, et c'est à droite de la gauche qu'alignent verticalement les neuf chiffres significatifs, écrits en italiques ; à leur droite, après un point de séparation, se lit le produit du nombre principal par chaque chiffre. Examinons par exemple la case 53. Le produit de 53 par 1 est le nombre 53 lui-même que nous voyons à côté du chiffre 1 ; le produit de 53 par 2 est 106 écrit après le chiffre 2 ; etc.

MULTIPLICATION. — Les tables renferment donc les produits de tous les nombres de 0, de deux et de trois chiffres avec les nombres d'un chiffre.

Soit à trouver le produit de 792 par 7.

Le chiffre 7, placé à droite des cases sur le bord des cases, indiquent la première case qu'on trouve en ouvrant à la page indiquée. Nous trouvons la page 700 et nous lisons dans la case 792, ligne 7, le produit 5544.

Soit à multiplier 678 par 5 827.

Nous écrivons les facteurs 279 et 5 827 chacun sur la gauche d'une bande ardoise. Nous prenons alors le chiffre 5 de la table, la case 279 désignée par le premier facteur. Cette case contient les produits de 279 par les chiffres multiplicateurs 5, 8, 2, 7, écrits dans la seconde bande ardoise ; nous inscrivons successivement ces produits sur l'arithmographe en tenant bien de placer toujours le premier chiffre de chacun d'eux dans la colonne de son chiffre multiplicateur, c'est-à-dire dans la colonne 5 le premier chiffre 1 du produit par 5, dans la colonne 8 le premier chiffre 2 du produit par 8, etc. (Le zéro du produit rien ou plus n'a pas son place). L'arithmographe : on donne seulement, si on le juge utile, un léger coup de crayon sur l'appareil dans les colonnes réservées à la partie de droite.

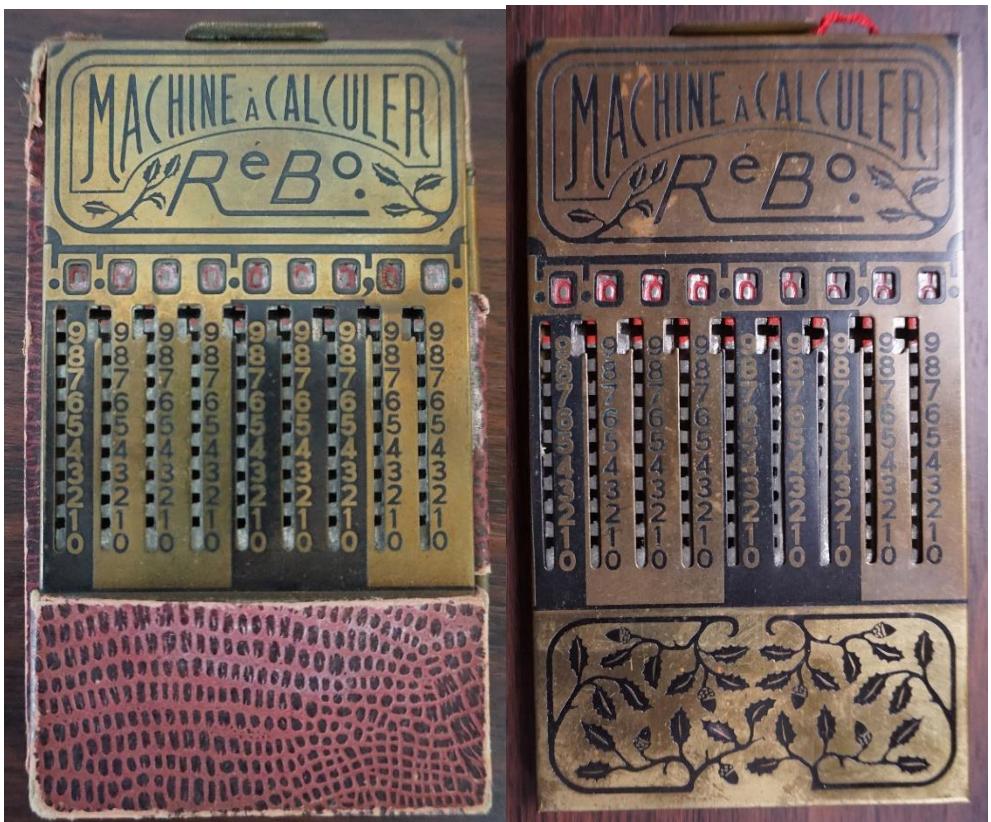

Le reste 371, suivi du chiffre 8, forme un second dividende partiel, 3718. Le plus grand nombre dans la case 696 qui peut être retranché de 3718 est 3484 précédé du chiffre 5 ; nous écrivons 5 au-dessus du dernier chiffre 8 du second dividende partiel, et nous retranchons 4 176 de 4 547.

Le reste 371, suivi du chiffre 8, forme un second dividende partiel, 3718. Le plus grand nombre dans la case 696 qui peut être retranché de 3718 est 3484 précédé du chiffre 5 ; nous écrivons 5 au-dessus du dernier chiffre 8 du second dividende partiel, et nous retranchons 4 176 de 4 547.

Le quotient 65 se lit sur la bande ardoise, et au-dessus, le reste 238.

Si l'on veut continuer l'opération, il suffit de faire une autre division à droite du reste et continuer l'opération, si l'on voulait avoir le quotient à moins d'un dixième ou d'un centième près.

Brevetée S.G.D.G.

Médaille d'Or, Diplôme de Grand Prix, Marseille 1935
Médaille d'Argent, Concours Lépine 1937
1^{er} Prix Ministre du Commerce, Marseille 1935

OFFICE SOCIÉTÉS ETÉTIQUETTES
PAR LE FIL
12, RUE DE CHAMBERY PARIS 9^e

Lx 195

CERTIFICAT DE GARANTIE DE 5 ANS

La présente machine est garantie CINQ ans à partir de cette date, contre tous vices de construction, à condition qu'il en soit fait un usage régulier. Nous déclinons toute responsabilité si la machine a été démontée ou abîmée.

N.B. — La machine doit être retournée franco avec le montant des frais de retour, tarif échantillon recommandé.

MODE D'EMPLOI

GÉNÉRALITÉS

Par son double tableau, la "RAYMOND" réalise deux mouvements de calcul indépendants, bien que mécaniquement conjugués.

Sur la face (+) s'exécutent les additions.

Sur la face (-) les soustractions.

Chaque face présente 9 colonnes chiffrees qui, de la droite vers la gauche, représentent unités, dizaines, etc. et millions.

Quelle que soit l'opération, il y a toujours gain de temps à poser directement sur la machine les nombres tels que vous les lisez ou les écrivez, en commençant par le chiffre de gauche. Le stylet pointé bien à fond dans l'entredeut correspond au chiffre à inscrire et tenu bien perpendiculairement au tableau sur lequel on opère.

Avant toute opération, il est absolument indispensable pour l'exactitude des calculs de ramener à zéro les feuilles des résultats situées au-dessus des colonnes chiffrees en introduisant la pointe du stylet dans le petit trou du poussoir descendu dans la fente centrale, située sous les colonnes chiffrees de la face (+) et en communiquant à ce poussoir un mouvement ascendant et descendant.

ADDITION (machine simple et double tableau)

Introduire bien perpendiculairement la pointe du stylet dans l'entredeut correspondant au chiffre à inscrire ou à additionner.

a) Si la crémillière est blanche, tirer vers le bas jusqu'au butoir inférieur (Fig. 1).

b) Si l'entredeut correspondant au chiffre à inscrire est entre deux dents rouges, remonter jusqu'en haut de la colonne, puis la pointe du stylet restant engagée dans la rainure lui faire suivre à gauche et vers le bas la découpe du métal jusqu'au fond de l'encoche (Fig. 2).

c) Si en cours d'opération apparaît un voyant rouge dans la fenêtre de résultat de la colonne voisine de celle où l'on opère (1), cela ne signifie pas « zéro » mais « dix », il suffit alors d'enfoncer le stylet dans l'entredeut correspondant au zéro de cette colonne où apparaît le voyant rouge et d'opérer comme en b (Fig. 2).

SOUSTRACTION (machine double tableau)

Inscrire le plus grand nombre sur la face (+).

Retourner ensuite votre "RAYMOND" de bas en haut et vous apercevrez alors le même nombre dans les fenêtres.

Inscrire sur la face (-) le ou les nombres à soustraire en opérant sur la face (-) comme si l'on opérait pour les additionner sur la face (+).

Les restes successifs apparaissent au fur et à mesure de l'inscription des nombres dans les fenêtres de résultats.

(1) Si le voyant rouge apparaît dans la colonne où l'on opère, cela décèle une fausse manœuvre ; la machine bloquée indique l'erreur. Il suffit alors pour rétablir l'opération, laissant le stylet enfoncé entre les dents rouges où il se trouve, de lui faire exécuter la manœuvre indiquée en b, fig. 2.

(2) Si au contraire apparaît un voyant blanc, il y a également fausse manœuvre ; la machine bloquée indique l'erreur. Il suffit, tout en laissant le stylet enfoncé entre les dents blanches où il se trouve, d'exécuter la manœuvre indiquée en a, fig. 1.

Pour faire de très longues additions, poser la machine à plat sur le registre en couvrant avec l'appareil l'addition à faire, ne laisser visible que le 1^{er} nombre, le poser sur la machine, découvrir le 2^o, le poser, et ainsi de suite jusqu'en bas, la machine servant de guide. L'addition sera rigoureusement exacte.

Placer ici le stylet et le faire agir dans le sens de la flèche

8. Belgium

Slide adder overview Belgium

The company Master produced slide adders in Liège from as early as 1926. The first models of the business still have a clearing bar for reset, similar to the Addiator. The later models have a crank on the right-hand side. A multSCRIPTOR was also offered on many models. The connection with a logical check by an electronic component is also very interesting.

11. USA

Slide adder overview USA

Clarence E. Locke lived from 1865 to 1945 and there are two US patents for slide adders in his name (1901 and 1905). Presumably a replica of Fowler's slide adder: The Universal Adding Machine. Justin Wilhelm Bamberger produced the replica with Bamberger Universal.

THE LOCKE ADDER

THE CALCULATOR MACHINE COMPANY, formerly Baby Calculator Company founded in 1923, later also Baby Calculator Machine Co. In 1925, 70,000 units were sold at a price of 2.50 dollars. In 1928 the Baby Calculator brand was registered at the patent office. From 1944 design changes are noticeable, see R192. In 1956 the model R232 was offered for 2.95 dollars. Sales were discontinued around 1960. Tom Thumb has the same production features as the Baby Calculator R232 model.

Sales brochure Baby Calculator Sales CO. from 1924

The Baby Calculator
The Vest Pocket Adding Machine

GUARANTEED

EXACT SIZE

**Add to Your Efficiency
Subtract the Errors
Multiply Your Time
Divide Bigger Profits**

WHAT OUR PRODUCT IS

It is the product of much study and experiment. The BABY CALCULATOR combines the good points we found in other machines of this type with the good points developed by our own experiments, bringing together in a complete unit the very best mechanical thought and skill available.

RELIABILITY

STEEL: What does the word bring to mind? Unconsciously we register the ideas of strength, durability and reliability. The BABY CALCULATOR is "built-in" strength, durability and reliability. Built in with thin sheets of steel. Cold rolled steel. This means efficiency and economy.

SIMPLICITY

Again BABY CALCULATOR is so very simple in construction. There are no parts to get out of order and call for adjustments. No wheels nor springs to oil. Built for continuous use and guaranteed by us indefinitely. Vest pocket size. Carried without inconvenience. Weighs 5 ounces.

ECONOMY

BABY CALCULATOR combines the best in materials and workmanship and a price within the reach of everyone. Retails at \$2.00—East Rocky Mountains, West of Rocky Mountains, \$2.50 each. Foreign countries, \$3.00.

Why I Am Interested

Here's the reaction you'll have—
I want to sell merchandise that is honestly built at an honest price and make an honest profit.

Honest Merchandise

I find upon investigation that the BABY CALCULATOR is one of the most honest pieces of merchandise I have ever seen. It will do all the manufacturer claims for it and is built of honest materials, just as the manufacturer says it is.

Honest Price

I find that many people do not want, or cannot afford to buy calculating machines, because of the price. Many housewives, clerks, small storekeepers and others would purchase a machine of this kind if one could be bought at a reasonable price. The BABY CALCULATOR sells for \$2.00 and will do the work of a high priced machine. ADDING—SUBTRACTING—MULTIPLYING and DIVIDING quickly and accurately, saving much time. Therefore, I can sell BABY CALCULATORS.

Honest Profit

I find that the manufacturer of the BABY CALCULATOR has considered carefully the needs of his salesmen. There is shown a realization that I pay my own way and that I must make an honest profit, otherwise I cannot sell his merchandise. That is why he pays a good commission.

"Baby Calculator"

MY PROSPECTS

No need for us to enumerate the thousands of men, women, boys and girls who have use for a moderately priced calculating machine, so we'll just mention all of the small shops and factories in and near your town. Many students—both high school and college, clerical workers, and so on and so forth. Even housewives buy BABY CALCULATORS to more easily and accurately take care of their home accounts.

The BABY CALCULATOR adds long columns in journals, pay rolls, etc. Makes bookkeeping a pleasure. Simplifies statistical work, wage accounts, estimates, invoices, stock-taking, technical arithmetic. A priceless tool for every office, commercial or technical, or in banking or insurance companies. For premium and advertising purposes it can not be equalled. Accurate, durable and fully guaranteed. Easy to learn.

The cost is very moderate and many people who could not otherwise avail themselves of the use of such a time and energy saver as the BABY CALCULATOR are buying them without any hesitation whatever.

Other salespeople tell us that they are often surprised at the out of the way places in which salesmen make their fifty cents of selling a BABY CALCULATOR to the village blacksmith, and so it goes, prospects everywhere along the highways and byways. All it takes is a little energy and ingenuity and prospects can be found. And that is all there is to selling BABY CALCULATORS. Just dig up the prospects.

OUR OFFER TO YOU

A Partnership in a Growing Business backed by a Firm who believes in Practical Co-operation, Men of Uttering Energy and Determination, who will work for you and with you, and Help you to Win a Big Success!

If you mean business, if you have the Ambition every American ought to have; if you believe in honest co-operation and appreciate an All-around Square Deal, and are determined to get your Full Share of the Wealth put on this Earth—then we invite you to read every word we have written you in this Folder, for here is the Stepping-stone by which you can climb to financial success.

In this age, every man has a chance to DETERMINE whether he will work for someone else, letting his employer make a profit on his labor, or to establish a business of his own and profit by the labor of others, as well as by his own concentrated efforts. Business building with a comfortable income in sight is the greatest game in the world. If you have a business of your own—a business that gives you a chance to increase your earnings, then you have something worthwhile to work for. And right here we offer you an opportunity to get into and control a fast-growing business of your own that will leap into big earnings.

We sincerely and truly believe our proposition to be the fairest, squarest and most liberal offer ever made. Ambitious, energetic men who want to share in the "thousands" that will be made yearly out of the sales of the "Baby Calculator." If you are willing to make an honest effort to get your share, then we invite you to join our company now while the offer is before you. YOU WILL NEVER BE SORRY.

"Baby Calculator"

One Live Wire Man Needed in Every Locality

We want an active distributor or representative in your field. You have the insight to accept this unusual opportunity. We will grant you EXCLUSIVE TERRITORY and all profits therein will be absolutely protected. Please bear in mind we are not selling territory rights, nor do we require the men who receive them to put up any deposit either in cash or in the form of a bond.

What we do insist in cases where exclusive territory is granted, is that a certain number of machines be purchased as an initial order, and a guarantee of so much business each month. The number of machines required purchased on an initial order depends upon the population in that particular territory. For example exclusive rights in the average populated state would warrant an initial order of 144 machines.

Should you not desire exclusive rights you may sell and order machines as you need them, providing no one else is working in your locality on an exclusive basis.

If you are travelling and want a wonderful selling sideline—the BABY CALCULATOR solves the problem.

TERRITORY is going fast. Play safe! Send in your application at once. First come, first served.

Please note that we do not state how much you are going to earn during the next six months or year selling the BABY CALCULATOR in any of our literature such as a great many other concerns are doing. It is all guess work on their part. The salary that a man earns selling the BABY CALCULATOR is directly commensurate with the amount of "energy" and "pep" he injects into his sales efforts.

We believe you will agree with us that it would be utterly foolish for us to sit back and tell you that you are going to earn a fabulous income selling our machines—not knowing how much effort you are going to put behind your selling. However, WE CAN TELL YOU WHAT OTHERS ARE MAKING AND WHAT YOU SHOULD MAKE!!

IMPORTANT

Let everyone remember after reading these pages, that this proposition, offered by a reliable firm, is not to be confused with the fly-by-night affairs that crowd the mails today. It is far above them as heaven is above earth. You are invited to join a prosperous and reputable growing business enterprise. The motto is sell and sell again in each locality where the BABY CALCULATOR machine is not already represented, and the offer can be made to only one man at a time, therefore, in fairness, you are respectfully requested to honor this invitation by writing your decision—whether it be yes or no—as soon as possible.

R820 How to use

How To Use The Valiant Personal Calculator

ALWAYS clear the calculator first before each calculation by pulling the clearing bar all the way out and then pushing it back. After the calculator is cleared the figure in all the answer windows should be "0". Should any arrow sign appear in any window insert pen in the column above it and pull toward window to bring out "0".

RULE 1 - When the hole in the figure column is white move pen towards the answer window and when the hole is red move pen away from the window and around the bend.

TO SET the first figure in the calculator at the beginning of each calculation after the calculator has been cleared, use the upper half or addition side and insert the pen in the holes opposite the appropriate numbers and move toward the answer windows.

Example : To set 3152

Insert pen in hole opposite "3" in fourth column from right and move toward window to as far as it will go. "3" will appear in the window. Next insert pen in hole opposite "1" in the third column from the right and move toward window. Then insert pen in hole opposite "5" in second column. Finally put pen in "2" in first column and move toward window. The complete figure "3152" will now appear in the answer windows.

TO ADD- Actually you have just done a multiple addition as follows :

$$3000 + 100 + 50 + 2 = 3152$$

Example : $4261 + 92 = 4353$

First clear calculator. Next set "4261" on calculator. Then still using the addition side, insert pen in hole opposite "9" in second column from right. Since the hole is in the red zone move pen away from the answer window and around the bend. Next insert pen in hole opposite "2" in first column and move toward window. The answer "4353" will appear in the windows.

TO SUBTRACT- First clear calculator and set the first figure using the addition side. Then use the lower half or subtraction side for the rest of the calculation.

Example : $3869 - 1953 = 1916$

After clearing calculator and setting first figure "3869", insert pen in hole "1" in fourth column on lower half and move upward toward window. Next insert pen in hole "9" in third column (red) and move away from window and around the bend. Then insert pen in hole "5" in the second column and move toward window. Finally insert pen in "3" in first column and move toward window. The answer "1916" now appears in the windows.

RULE 2- When arrows appear in the windows during a calculation, simply insert the pen in "0" in the corresponding column and move away from the window and around the bend.

Example : $476 + 228 = 704$

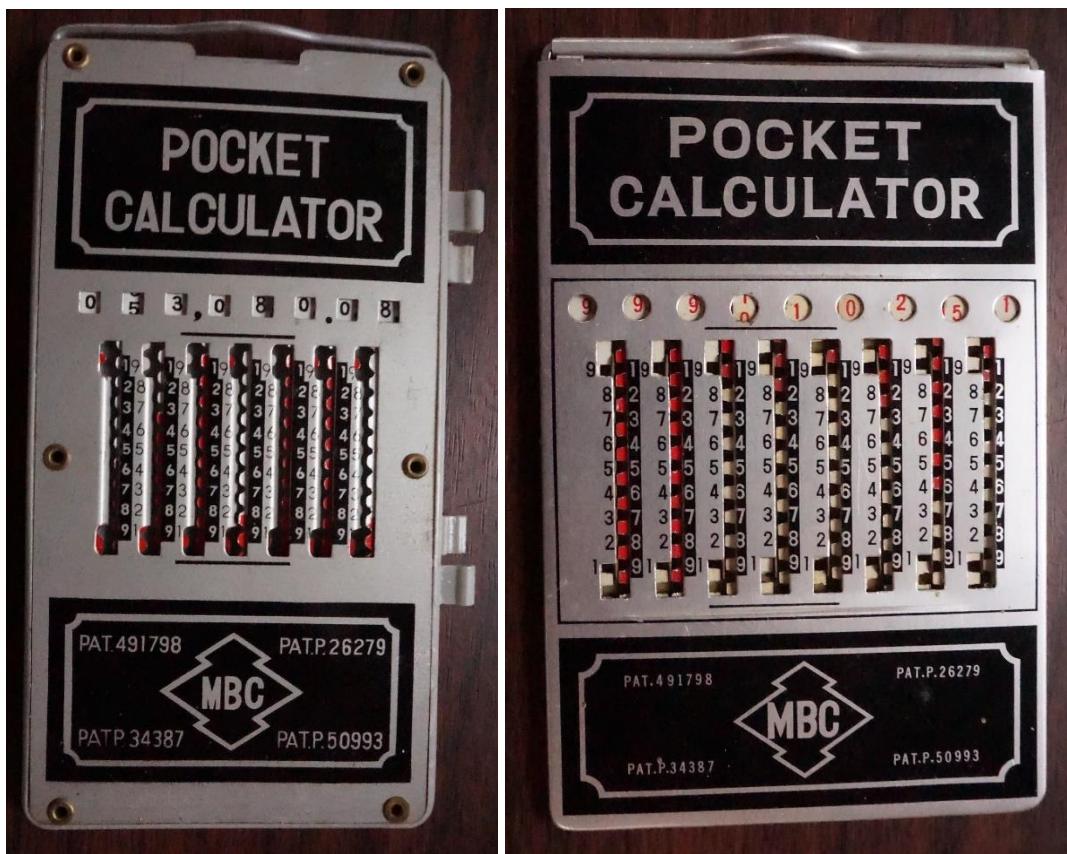

Clear and set first figure. Insert pen in "2" in third column and move toward window. Insert pen in "2" on second and move toward window. Insert pen in "8" on first and move away from window and around bend. "6\frac{1}{4}" now appears in the windows. Insert pen in "0" on second and move away from window and around. The correct answer "704" now appears in the windows.

R777 Trebla Sterling

R439 Ofling

izquierda una vez llegado al tope. Este caso se verifica solamente cuando el círculo totalizador correspondiente, marca el número 9.

Si efectuando las operaciones de restar se nota que no puede arrastrarse la unidad de la cremallera de la izquierda se pone el punzón en el núm. 1 de dicha cremallera de la izquierda y se arrasta hacia abajo y, como siempre, se efectúa el movimiento de rotación. Este caso se verifica solamente cuando se encuentra el 0 en el círculo correspondiente.

Para borrar las cantidades del totalizador, se levanta hacia arriba la varilla de latón hasta llegar al tope.

EJEMPLOS

Sumar: 250,— + 335,— + 510,— cuyo total es 1.095.

Siguiendo las instrucciones del prospecto pegado en la cubierta, con el punzón se marca el 250,— en las cremalleras de los números encarnados que corresponden a las centenas, después se añade el 335,— que da como suma 585,— a esta cantidad se añade el 510,— Al marcar el 5,— por corresponder este número arriba de la marca encarnada de las cremalleras, el movimiento con el punzón se hará hacia arriba y al final del recorrido se hará el movimiento de rotación hacia la izquierda arrastrando así el diente de la cremallera de la iz-

quierda que marcará el número 1 que corresponde al millar. Se marca luego el 1 en la cremallera de la decena y el total dará como resultado 1.095,— como es natural el cero no hace falta marcarlo. Como esta operación se verifican las de sumar.

Restar: Las cantidades 95,— 800,—, 72,— de la su-

ma anterior o sea del número 1.095, cuya resta es de 128,— Obrando en el cuadrante superior y siguiendo siempre las instrucciones del prospecto, al marcar el 9, se hará el movimiento hacia arriba por corresponder este número arriba de la marca encarnada de la cremallera; se hará lo mismo con el 5, dando así como resultado 1.000. Para restar el 800, cuando se marque el 8, se hará el movimiento hacia abajo, por corresponder abajo de la marca encarnada de la cremallera, y al llegar al tope se hará el movimiento de rotación hacia la izquierda, arrastrando la unidad de la cremallera de la izquierda y quedando así una resta de 200. Para restar el 72 se arrasta hacia abajo por corresponder estos números abajo de las marcas encarnadas, haciendo siempre los citados movimientos de rotación hacia la izquierda. El resultado de la resta es, por lo tanto, de 128. Con arreglo a esta demostración se hacen las demás operaciones de restar.

Multiplicar: 258,— × 132,— cuyo producto es 34.056.

Primeros se multiplica 258 × 2, para lo cual se repite dos veces el número 258 que da 516. Para multiplicar por 3, se repite tres veces más el 258, empezando por una columna más a la izquierda, y por lo tanto en la primera columna de los millares, el producto será 8.256. Por último se multiplica por 1 marcando una vez el 258, y empezando en la segunda columna de los millares. El producto total es de 34.056.

Siguiendo estas instrucciones se realiza cualquier multiplicación.

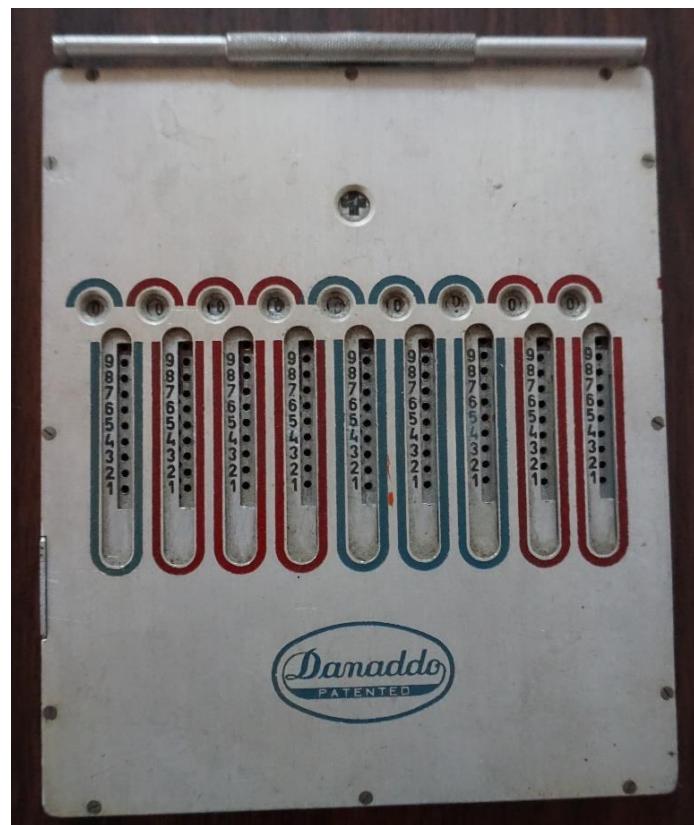

Dividir: 376,— : 15,— = 25 de cociente y 1 de resta.

Se coloca en los círculos totalizadores el 376, de las dos primeras cifras, o sea del 37 se van sustraerán cuantas veces se pueda el 15, y vemos que son 2 veces, quedando 7 como resta, que con el 6 hacen 76, se hace lo propio con el 76, y vemos que el 15 cabe 5 veces con una resta de 1. El resultado total de la división, es por lo tanto 25 de cociente y 1 de resta.

Por este procedimiento, se hacen todas las operaciones de dividir.

If something is missing, please bear with me and let me know. Inventors who have only applied for a patent are not listed. There are probably even larger variants of the Louis Troncet Arithmographe, see slide adder France.

The idea of the slide adder is an improvement of the Abacus

Replica of a Roman abacus

16. Overviews and information

The overviews and information refer to slide adders in this document.

16.1. Slide adder types

As announced in Chapter 1, I would like to provide an overview of the various slide adder types here.

The overflow to the next highest digit can be used for many tasks. Currencies, for example, have very unusual units, see Pound Shilling Pence. Or length, weight and liquid specifications in the USA have to be added together in a time-consuming process. As shown with the Fractomator in Chapter 1, with the slide adder you define a 'number system' and add a unit to it. The overflow 10 will be found in all models.

Different sliders

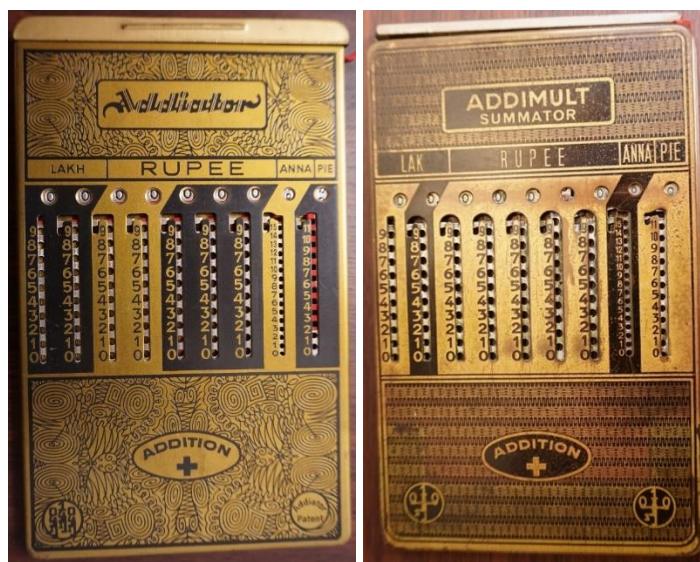

There is one character (character string) per unit. For 10 units you would use the left slider, for 12 units the centre one and for 16 the right one. Instead of 1/8 there could also be a 2 (=2/16). As soon as you add 1 to the highest value, you always get the result 1 0 and this is independent of the slide adder used. This is why it is so easy to combine different slide adders.

A. Currency converter with preset currency.

Slide adder Rupee

1 LAKH = 100000 RUPEE / 1 RUPEE = 16 ANNA (ANNA valid until 1957) / 1 ANNA = 12 PIE (PIE valid until 1947)

16.2 Slide adder with slide rule

Now that the slide adder types have found a possible definition, I would like to emphasise further features.

In the mid-1930s, Faber Castell and Addiator invented the combination slide adder and slide rule. Further models from Asia were added in the following 50 years. As there is no conversion here, I do not want to call this combination a slide adder type.

Bamberger Universal R831

Bamberger Omega R830

Controleur des Calculs R812

16.3. Slide adder characteristic Result line

After this short intermezzo, I would now like to look at the design of the slide adder from the inventor's point of view. No, from the perspective of an inventor who sees a customer working with it.

In contrast to Abacus, the individual slide adders are easily fixed. This also makes it easier to transfer results to a new calculation. Just look at the Roman Abacus and set it up, and all the values have disappeared. Another difference to the Abacus is the practical result line.

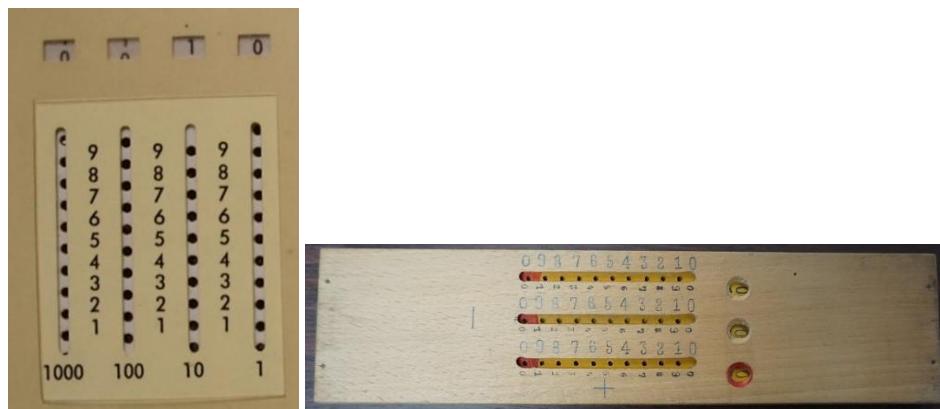

Sometimes there are even two of them, usually at the top, often in the centre, sometimes at the bottom, on the back side or on the right, see alignment.

The following list is not historical.

First the one-sided models

I. Result line without Carryover

No support for carryover and subtraction (because only intended for addition?)

Overview of models Result without Carryover

IV. Result line at the top with Carryover and reversable plate

Adisuma and Salda have a reversible plate with the numbers 1 to 9 per column. Trebla also includes the number 0. With the Correntator family it is only necessary to print half of the numbers on the reversible plate, the rest is on the front plate. As with the slide adder with opposing columns, you have to slide upwards for the subtraction. The system of partner numbers is also concealed here.

V. Result line at the bottom with Carryover and Moveable cover

The Mercedes company discovered the trick with the moveable cover in 1912 and named the slide adder after it. It was a simple way to support subtraction using a moveable plate with opposing numerical values. Apparently the invention was also known overseas after the First World War, because Gray and Tasco are very similar. The result can be found below. The 0 is not present as a numerical value. A carryover is also provided for the subtraction.

Overview slide adder Moveable cover

Gray R231 and R778
 Summax R328 and R408
 Tasco R118
 Trick R365, R774 and R859

VI. Result line at the top with Carryover for addition and subtraction and opposing column

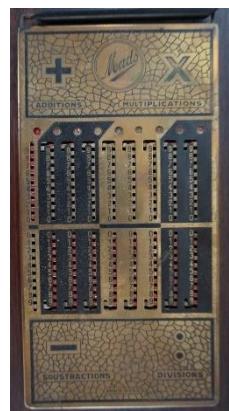

To further support subtraction, a separate carryover for subtraction has been created in addition to the opposing column.

IX. Result line centre subtraction top addition bottom

If you swap addition and subtraction for the previous solution, you also have to align the numerical values differently. Here, the highest numerical values are in the centre. This also means that the carryover is not at the top or bottom, but also in the centre. The Produx development can be regarded as the origin here.

X. Result line on the back side

The Sascol company developed a very interesting format in the 1950s. The data is set on the front side and the result is on the back side. By the way, a positive and negative carryover is possible due to the additional fields above and below the value entry. The subtraction is supported by the aperture labelled with complementary numbers inserted at the top left. The aperture can be pulled out and placed to the right of the last row of numbers. Reset can be carried out via the clips below the negative carryover.

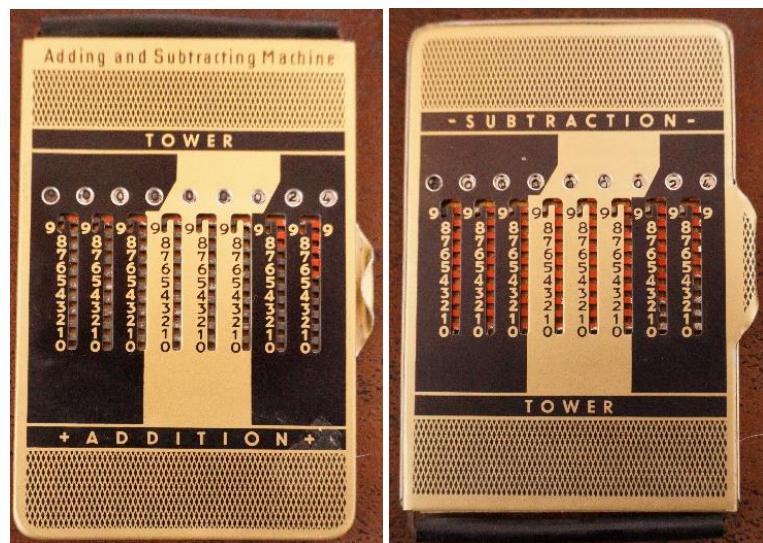

Overview slide adder Result line on the back side

MICRO SUMMA OMNIA (Two variants)

XI. Two result lines for addition on the front- and subtraction on the back side

Addition and subtraction is supported by slide adder in a simple way - in the simplest case, drag downwards for addition and upwards for subtraction. The carryover to the next higher digit is usually the biggest problem. In many cases, the design is protected by patent. Addiator, for example, has patented the two-sided design. Two-sided means that on one side you add and on the back side you can use the intermediate result to continue directly with the subtraction. It is important that the slide adder is not turned like a book page, but upside down, otherwise the smallest would become the highest digit. As a result: the result line is always at the top and the shifting always takes place downwards with this system. In addition to Addiator, the company Addimult also developed two-sided slide adders, not entirely unrelated, as Wolfgang Kübler was the son of Carl Kübler, the founder of Addiator. The French company Raymond has won several prizes with its slide adders and also produced two-sided models.

16.4. Slide adder characteristic Result grouping

- a. The result line feature is not the only special feature of a slide adder. The display of the result is also very important.

The last digits of the result field are often interpreted as decimal places. Depending on the currency, the next unit is reached after 2 or 3 digits. With 3 digits, one speaks of weak currency, but one could also calculate weights or volumes with 3 decimals. slide adders with 2 decimal places were standard in Germany, so I would only like to mention the exceptions here.

16.5. Slide adder characteristic Clearing

There are probably many other features, but the reset function seems important to me.

There are only a few slide adders without a reset function. The reset function ensures that the slide adder is reset to its initial position and the result is set to 0.

- With a clearing bar for reset, a rod pulls the individual sliders up to the housing head. The result line is aligned so that a 0 is now displayed on all digits. Ultimately, the function is solved in different technical ways.

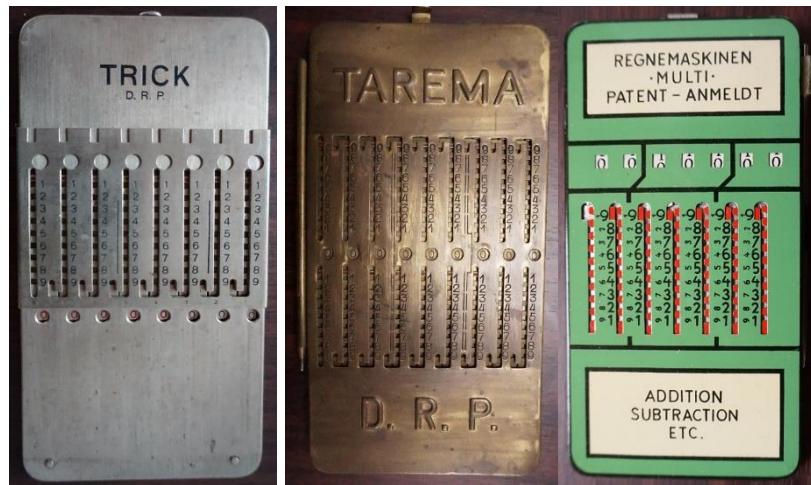

Overview slide adder Clearing via reset rod
